Evidence-Based Professional Development of Science Teachers in Two Countries

Abstract

The focus of this collaborative research project of King's College London, and the Weizmann Institute, Israel. project is on investigating the ways in which teachers can demonstrate accomplished teaching in a specific domain of science and on the teacher learning that is generated through continuing professional development programs (CPD) that lead towards such practice. The interest lies in what processes and inputs are required to help secondary school science teachers develop expertise in a specific aspect of science teaching. It focuses on the design of the CPD programmes and examines the importance of an evidence-based approach through portfolio-construction in which professional dialogue paves the way for teacher learning. The set of papers highlight the need to set professional challenge while tailoring CPD to teachers' needs to create the environment in which teachers can advance and transform their practice. The cross-culture perspective added to the richness of the development and enabled the researchers to examine which aspects were fundamental to the design by considering similarities and differences between the domains.

Rationale and theoretical background

The studies described in this set of papers were carried out as part of a three year cycle of collaborative research and development activities conducted by King's College, London UK and the Weizmann Institute of Science, Israel. The project presented in this special issue is based on the premise that in order to advance the educational system and improve the practice of teachers, it is essential to promote the professionalism of teachers beyond initial training through *Continuing Professional Development* (CPD). More specifically, our interest centered on what processes and inputs are required to help secondary school science teachers develop expertise in specific aspects of science teaching and how engaging with these processes helped teachers reflect on, develop and learn about their pedagogy.

The overarching goal has been to design *evidence-based* CPD programmes for developing accomplished teaching in science. By this we mean CPD programmes which require the teacher participants to take part in a professional development programme that requires them to seek and identify evidence of practice in their own classrooms. The focus for this evidence-based CPD approach is the process of collection, analysis and reflection on evidence arising from classrooms and how this provides the impetus and motivation for teachers to transform their practice.

The following six domains of science education were chosen for developing these programmes:

1. Scientific enquiry with investigations,
2. Scientific discourse and argumentation,

3. Classroom assessment
 4. Knowledge integration in physics,
 5. Learning skills in science,
 6. Inquiry in the chemistry laboratory.

These domains are not intended to provide a comprehensive description of expertise in science teaching but rather they are illustrative of some of the important qualities needed by an accomplished teacher of science. These six domains of science education were each used as a vehicle to enhance teacher learning through engaging in CPD programmes and producing an evidence-based portfolio. The CPD programmes were designed to both increase teachers' knowledge of specific domains and help them reflect on how such ideas can be developed and interpreted into pedagogy. This included helping teachers experiment and reflect on how the new ideas could be developed and integrated into classroom practice. It also provided opportunities for them to understand the utility of using evidence as part of their regular cycle of reflection and development on practice.

The first three domains were developed in the UK and the others in Israel. It was assumed that the collaborative effort between two nations that possess different educational structure and philosophy, as well as different cultural beliefs and practices of the students, would provide rich and versatile information regarding the dynamics and constraints of the model. The collaboration also encouraged the CPD developers to clarify and explain the reasoning behind their decisions and actions within the individual CPD programmes with colleagues who were familiar with the research literature and confident in their own domain, but unfamiliar with the ways teaching

1
2
3 ideas were interpreted and implemented in the other country. This helped us question
4
5 the status quo and seek new possibilities and alternative solutions instead of simply
6
7 accepting what was already in place or follow trends that had previously directed
8
9 particular teaching and CPD approaches. It also provided us with a broader and richer
10
11 base on which to focus development of the evidence-based aspect of the CPD work
12
13 within the context of our specific domains. The cross-country liaison encouraged us to
14
15 question more carefully each aspect of the CPD programme. The culture of CPD and
16
17 teacher learning was different in the two countries and so selection of approaches,
18
19 which we might have previously made unthinkingly, now had to be explained to our
20
21 counterpart developers. This caused us to reflect more thoroughly than we might have
22
23 done if the project had only been placed in one country. Equally, new ideas from the
24
25 other country provided us with a greater choice of possibilities for the CPD design at
26
27 all stages in the research programme.
28
29
30
31
32
33
34
35
36
37
38

39 This collaborative approach helped both with the pragmatics of the developmental
40
41 part of the work while informing the theoretical thinking underpinning the project.
42
43 For example, one Israeli researcher and one UK researcher worked together to review
44
45 the research on accomplished practice and produce a working paper to support the
46
47 other domains. Another pair from the two countries exchanged ideas about the
48
49 preparation and use of the portfolio, which helped all six domains find better ways of
50
51 supporting their teachers in preparing the portfolios. A further pair of researchers,
52
53 from Israel and the UK, compared the response by their teachers to the first few CPD
54
55 sessions and their findings influenced the other domains in the design of their CPD
56
57 programmes.
58
59
60

1
2
3 This set of papers describes and offers insights into the CPD programmes that have
4
5
6 been developed in these science learning domains. The papers report on selected
7
8
9 aspects of research on the implementation process and the professional development
10
11 and practice of teachers. They provide an opening into investigating the role of
12
13 professional dialogue and the development of teacher learning communities within the
14
15 CPD arena and draw on an extensive research base (Shulman (1992), Bell & Gilbert
16
17 (1996), Hoban (2002), Loucks-Horsley et al (2003) which puts teacher learning at the
18
19 centre of the CPD agenda.
20
21

22
23 Within a large project, where researchers have specific foci for their research, it is not
24
25
26 unusual to have central tenets for research which become moulded and adapted within
27
28 the smaller units of the research. For example, the paper by Shirley Simon and Susan
29
30 Johnson focuses on how the final portfolios demonstrate teachers' progression
31
32 towards accomplishment, while that by the Knowledge Integration team, led by Bat-
33
34 Sheva Eylon, centres on the changing categories of teacher talk in the early teacher
35
36 meetings compared to later ones. For this reason, we lay out the main areas of the
37
38 research programme below, while recognizing that there is variation of these in some
39
40 of the domains and refinement of specific ideas within the individual papers. Some of
41
42 the central research questions that fashioned our approach were:
43
44
45
46
47

48 What are the qualities of an “accomplished” teacher of science?
49
50

51
52 What evidence can be collected by teachers to explore the teaching and learning
53
54 processes within their own classrooms?
55
56

57
58 How can the collection of evidence provide a focus for reflection within a programme
59
60 of continuing professional development for science teachers?

1
2
3 This set of papers reports mainly on the last research question although some details
4 relating to the first three questions will, by necessity, be reported also. This paper
5 provides the backdrop for the papers that follow. It begins by considering the
6 evidence-based approach and what we mean by accomplished teaching. It then
7 focuses on the design of the evidence-based CPD programmes and goes on to explore
8 the use that portfolios were put to as part of this process. The developmental aim was
9 to develop, adapt and hone a CPD programme in each domain and to produce a set of
10 materials that would help CPD providers introduce similar programmes in the future.
11 The research aim was to explore how involvement within an evidence-based CPD
12 programme affected teacher learning and practice for that domain.

40

41 **The "evidence-based" approach**

42
43

44 Effective CPD needs to provide an opportunity for teacher reflection and learning
45 about how new practices can be evolved or moulded from existing classroom practice.
46 Teachers need to familiarize themselves with new ideas and also understand the
47 implications for themselves as teachers and for their learners in the classroom before
48 they adopt and adapt them. If the new approach differs greatly from their previous
49 practice, this involves them reshaping their own beliefs regarding science teaching
50 and learning. It thus involves both considering core principles and issues as well as
51 contextualizing these in developing practice and approaches. The challenge comes
52
53
54
55
56
57
58
59
60

1
2
3 when teachers return to their schools, where their ideas developed during the CPD
4 sessions might falter outside the supportive climate of the Teacher Meetings. This is
5 particularly so where the innovations introduced differ markedly from the 'normal'
6 practice within the school and, as such, challenge the "*dominant structures and values*

that hold habits in place" (Ruddock, 1991, pp.27-28).

Conventional methods of conducting CPD have usually been too short and occasional to foster change in teacher classroom practice (Loucks-Horsley, Hewson, Love and Stiles 1998). Research highlights some important features that characterize effective CPD programmes (e.g., Ball and Cohen, 1999; Loucks-Horsley, Hewson, Love and Stiles, 1998; Bell and Gilbert, 1998; Kennedy, 1998; Marx, Freeman, Krajick and Blumenfeld, 1998; Putnam and Borko, 2000; Roth, 2002; Borko, 2004).:

- Engaging teachers in collaborative long-term inquiries into teaching practice and student learning.
- Situating these inquiries into problem-based contexts that place content as central and integrated with pedagogical issues.
- Enabling teachers to see such issues as embedded in real classroom contexts through reflections and discussions of each others' teaching and/or examination of students' work.
- Focusing on the specific content or curriculum teachers will be implementing such that teachers are given time to work out what and how they need to adapt what they already do.

Effective professional development needs to provide an opportunity for teacher reflection and learning about how new practices can be evolved or shaped from

1
2
3 existing classroom practice. This is not a simple task in that it requires teachers to re-
4
5 examine what they do and how they might do it differently. In addition, the attainment
6
7 of complex learning goals in science by students, such as the ones targeted in the
8
9 domains of the present project, demand significant change in teachers' roles.
10
11

12
13 The CPD programmes developed in this project employ an "evidence-based"
14
15 approach to support collaborative inquiries in the teachers' own classrooms. By the
16
17 term "evidence" we mean a collection of artefacts in a particular science learning
18
19 domain that show teacher's work and students' learning, combined with written
20
21 commentaries that explain the role of the artefacts within the learning context. Ball
22
23 (2004) refers to "harnessing" recorded teachers' experience as a means for teachers'
24
25 learning individually and collectively and creating shared professional knowledge.
26
27 Such records of practice (evidence) enable teachers to examine their own instructional
28
29 strategies and students' learning alongside their previous practice and those of their
30
31 colleagues. The preparation of the evidence, and the reflection that follows it, can help
32
33 teachers gain insights, evaluate goals, better understand the relationship between
34
35 components of practice or events, and view them within a broader cultural, moral, and
36
37 professional perspectives. Namely, the evidence and the activities associated with
38
39 its processing foster the creation of a community of practice (Lave and Wenger,
40
41 1991). The process of collecting and explaining and justifying these evidence sources
42
43 therefore helps in enhancing teachers' development towards accomplishment in their
44
45 practice.

59 Accomplished Teaching
60

1
2
3 Schulman & Schulman (2004, pp.259) stipulate that “ *an accomplished teacher is a*
4 *member of a professional community who is ready, willing, and able to learn from his*
5 *or her teaching experiences*”. They go on to argue that the features of teacher
6 development and so a necessary part of what a CPD programme should provide are
7 *Vision, Motivation, Understanding, Practice, Reflection and Community*. While we
8 whole-heartedly agreed that these were necessary aspects to aid teacher learning, our
9 feeling was that the evidence-based approach would provide the means by which the
10 focus, practice and reflection could drive the understanding through the professional
11 dialogue that it engendered within the CPD Teacher Meetings. In other words, the
12 evidence-based approach formed the catalyst for high levels of socio-cultural
13 interaction between the teachers on the CPD programme so that they were able to
14 overcome the hurdles of implementing these new practices (Cuban, 1998) on their
15 return to their schools
16

33
34
35 Realizing the complexity of skills involved in collecting and using evidence, the CPD
36 programmes involve activities designed to directly develop teachers' skills in
37 collecting, sharing and reflecting on evidence. These activities also provide an
38 opportunity for the CPD provider to offer guidance, tools and support in this
39 endeavour. The development of these evidence related skills is intertwined with the
40 development of expertise in a particular domain of science learning and so, while
41 there was commonality in approach within the six science domains, there was also, by
42 necessity, variation in these activities. Some of the programmes offered new
43 approaches to the teachers, such as Knowledge Integration in Physics for the Israeli
44 teachers, while others built on existing practice, such as the Classroom Assessment
45 programme, which helped UK teachers concentrate on aspects of science teaching that
46 was already part of their existing repertoire and look at how they might improve it.

1
2
3 The major goal of the CPD models produced in this project has been to promote
4 expert teaching. Both the UK and Israeli teachers preferred to use the term
5 accomplished rather than expert teaching. Their argument arose from the idea that

They believed that as they honed their classroom practice they grew towards
accomplishment rather than becoming expert within a domain.

Accomplished teaching of science can be defined in terms of the knowledge which
teachers use in their teaching (Guskey and Huberman 1995; Hewson and Hewson
1988; Magnusson, Krajcik and Borko. 1999; Shulman 1987). This knowledge has
been categorised as general pedagogical knowledge, subject-matter knowledge, and
pedagogical content knowledge (Borko and Putnam, 1996). The descriptions of
accomplished teaching in each domain were firmly grounded in both extensive
reviews of the literature and in expert teachers' classroom practices. Our work is
concerned with the qualities that distinguish an accomplished teacher from a simply
competent one and how the CPD programmes can help teachers progress towards
accomplished practice in each of the domains. This involves the teacher in developing
both their subject matter knowledge and pedagogical content knowledge. Subject
matter knowledge includes teacher's knowledge of facts, concepts and procedures
within a particular domain, such as scientific enquiry.

Pedagogical content knowledge is concerned with the teaching and learning of a
particular domain: knowing how students learn within that domain, knowing their

1
2
3 common misconceptions and the particular difficulties and challenges of that domain,
4
5 and being able to apply this knowledge to teaching and learning within that particular
6
7 domain (Shulman, 1987). Another aspect of accomplished teaching termed
8
9 "*scholarship of teaching*" is proposed by Hutchings and Shulman (1999). They
10
11 suggest that besides excellent teaching, teachers should be able to articulate their
12
13 teaching actions and thinking in a way that others can learn from it and should be
14
15 available for community discourse and study. They also claim that this public feature
16
17 of teaching improved teachers' learning and performance through reflection and
18
19 professional discourse.
20
21
22
23
24
25
26
27
28

29 We assume that in order to increase the effectiveness of the CPD programmes, it is
30
31 important that the teachers share what is meant by accomplished practice in the
32
33 particular domain. The shared vision and its explication can provide a sense of
34
35 direction, and guide the teachers to focus their efforts towards the central goals of
36
37 accomplished teaching in the particular domain. Indeed, teachers commented that
38
39 agreed standards to define accomplished teaching in specific domains were useful as
40
41 tools to improve competence and against which to judge competence as shown in
42
43 evidence collected from the classroom. For us as CPD providers the definitions of
44
45 accomplished teaching within each domain have been an integral part of our planning
46
47 of new CPD programmes and as tools to help teachers to map progress and decide on
48
49 next steps towards accomplished teaching.
50
51
52
53
54
55

56 It should be noted that coming to agreement about accomplished teaching in each
57
58 domain was grounded in different cultural contexts, different countries and to some
59
60 extent with teachers of students of different ages. Competences that might be

1
2
3 considered to be basic in one cultural context, may be considered to be advanced in
4 another and vice versa. Although there are many commonalities between science
5 teaching in the UK and in Israel, there are also differences. It should not, therefore,
6 be surprising if there are differences between say the accomplished teaching of
7 scientific enquiry in the UK and the accomplished teaching of inquiry in Israel. What
8 would be surprising, however, would be if there were not many more commonalities
9 in the descriptions.

18
19
20
21
22
23
24

25 **The Continuing Professional Development Programmes**

26
27
28 The project was conducted over the period of three years (2002-2005). The project
29 was carried out in collaboration with teachers to bridge between theory and practice
30 and to increase the validity and feasibility of the proposed programmes.
31
32
33
34

35
36 The project consisted of three phases. In each phase a new cohort of teachers
37 undertook the CPD programmes:
38
39

- 40
41 • Phase 1- the CPD programmes were designed and piloted, either using teachers
42 who had some expertise in the domain or, in the case of the Israelis, leading
43 (exemplary) teachers (N= 32).
44
45
- 46
47 • Phase 2 -the CPD programmes were trialed and evaluated by experienced
48 teachers who had only a small amount of knowledge of the specific domain
49 (N= 38).
50
51
- 52
53 • Phase 3 - the CPD programmes were refined and then trialed again by teachers
54 with minimal knowledge of the domain(N= 34).
55
56
57
58
59
60

1
2
3 Each of the CPD programmes involved the teachers in some 30-40 hours of teacher
4 meetings. The organization of the CPD programmes varied across the domains to try
5 and fit in with preferred timings for both the teachers and the researchers. Typically,
6 the UK programmes were divided into six to ten whole or half-day sessions over the
7 course of two school terms, with periods between teacher meetings utilized by the
8 teachers to explore and develop ideas in their own classrooms. In Israel, the
9 programmes generally began with an intensive 2-3 days of CPD, where the teachers
10 became fully immersed in the ideas and practices of the specific domain. This was
11 then followed by teacher meetings at roughly monthly intervals over the course of
12

eight to ten months.

Each CPD programme had some specific characteristics that were shaped by previous CPD programmes that the developers had been involved in and each was also influenced by the pedagogical content knowledge of the specific domain, in that the CPD providers attempted to model some aspects of the approach (Hogan and Berkowitz, 2000). However, several features were common to all domains. All the programmes dealt with ways to implement the pedagogic approaches using concrete instances derived from classroom practice. This provided the impetus for professional dialogue as the teachers came to recognize particular techniques and to evaluate how these might be incorporated into their existing teaching repertoire. Teachers were then able to plan classroom activities and work out, with support from the CPD providers and their colleagues on the CPD programme, how they might capture evidence of their changing practice.

1
2
3
4 In all the domains, the first few attempts at collecting evidence of practice were
5
6 relatively prescriptive in nature, but as the teachers became more adept at collecting
7
8 evidence and gained confidence and competence within the specific domain they
9
10 began to select from a wider range of evidence sources. The teachers thus increased
11
12 their autonomy in line with their development towards accomplished teaching.
13
14

15
16
17 The goals and approach of the CPD programmes were designed to allow for this
18
19 evolution of practice and understanding in that the activities and sessions fostered
20
21
22 teacher learning in the particular science domains by:

- 23
24 • Helping teachers become aware of the need to stimulate and support students
25
26 in learning activities in the domain
- 27
28 • Exposing teachers to central ideas in the domain and a variety of instructional
29
30 activities
- 31
32 • Encouraging teachers to customise activities in the domain to their needs and
33
34 implement them effectively
- 35
36 • Providing guidance to a wide range of teachers enabling them to evidence
37
38 their practice and improve their knowledge and skills
- 39
40 • Guiding teachers in collecting evidence of accomplished teaching
- 41
42 • Facilitating meetings where teachers could discuss and reflect on the
43
44 documented practice, with presenting artefacts as evidence that demonstrated
45
46 their changing practice
- 47

3 The goals were achieved in each of the domains by ensuring that the CPD
4 programmes included the following elements: setting goals, learning from examples
5 by reflection on the evidences of practice that were produced, customising and
6 developing ownership of the next steps towards accomplishment. There were,
7 however, a range of ways in which this process was carried out in the different
8 domains as described in the different papers. Towards the end of each CPD
9 programme, the teachers submitted a portfolio that documented evidence to
10 demonstrate their progress towards accomplished teaching in one of the six domains.
11 Outlines of the CPD programmes have been published (2007) and more detailed
12 information can be located on poecpd.org.uk.

30 Use of the Portfolio

31 An essential feature of each programme was the construction of an individual
32 portfolio by participating teachers, which would include evidence of how teaching
33 strategies had been implemented and how teachers reflected on their practice. In each
34 domain, the teachers were provided with expert input based on previous research that
35 helped to guide the construction of teachers' portfolios. In addition, sharing and
36 discussing portfolio entries with peers in the programme was perceived as a means of
37 enhancing reflective practice through collaborative analysis of evidence.
38

47
48
49
50

51 Previous research that supports the potential of portfolios as a tool for enhancing
52 learning and development has been widely reviewed and documented (Lyons, 1998;
53 Dinham & Scott, 2003; Orland-Barak, 2005). Yet portfolios have been defined in
54 different ways depending on their purpose, for example, for certification, selection,
55 appraisal or promotion, as well as for professional development (Klenowski, 2002).
56
57
58
59
60

1
2
3 The portfolio used for CPD purposes usually involves the selection of materials that
4 provide evidence for critical examination of teaching and learning practices. The
5 emphasis in portfolio development could be on the process of construction or on the
6 quality of the product, and there are tensions between these two purposes that should
7 inform the use of portfolios for CPD. If the product is the goal then this suggests a
8 summative approach, where comparison might be made between the finished
9 portfolios, which in turn compares the teachers' competence within the group. Such
10 an emphasis is hardly conducive to collaborative endeavour. It could also render the
11 CPD provider the role of judge, and hence conflict with their role as facilitator and
12 guide. If a more formative approach was to be undertaken, then it seemed important
13 that the emphasis of the professional development effort should centre on the process
14 of constructing the portfolio rather than the finished product. Linked to this was the
15 necessity of creating a professional development environment where teachers were
16 open to sharing their ideas, as well as seeking and offering support amongst their
17 peers. The CPD programmes of the King's -Weizmann project sought to incorporate
18 substantive conversation and collaboration between participants as they engaged in
19 the process of constructing individual portfolios to foster a collaborative professional
20 development environment.

50 Research Tools and Analyses

51 Throughout the three year project, data were collected both by the teachers
52 involved in the CPD programme and the researchers. Video or audio-
53 recordings were made of each CPD teacher meeting and data were also
54 collected from interviews, classroom observations, classroom videos and
55 questionnaires. The completed portfolios also provided a rich data source.
56
57
58
59
60

1
2
3
4
5
6 Permission was sought from the teachers to use the work they produced for
7
8 their portfolio entries as well as that from utterances at teacher meetings and
9
10 the interview and classroom observation data. Anonymity of teachers and
11
12 schools was ensured by use of pseudonyms on all documentation and by
13
14 ensuring safe and confidential storage of all project artifacts and data.
15
16

17
18
19
20 The approach to analysis followed a similar cycle of processes within each of
21
22 the research teams for the six science domains. Interviews were transcribed,
23
24 open-coded by pairs of researchers using a grounded-theory approach (Stauss
25
26 and Corbin, 1994) from which emerging themes were examined, tested for
27
28 validity across data sets by blind comparisons and finally used to write
29
30 detailed vignettes or case studies of each of the teachers.
31
32
33

34
35
36 For the blind comparisons, a sample of at least half the interviews was selected
37
38 randomly. These were independently coded and then analyses compared.
39
40 Coding accuracy was improved by writing theme code descriptors and, in some
41
42 cases, further coding through paired discussion and this resulted in raising
43
44 coding agreement rate above 70%.
45
46
47
48
49

50
51 Audio and videotapes of the CPD teacher meetings were not transcribed
52
53 always in full. Instead, they were listened to and summarized independently
54
55 by at least two researchers in each domain. This decision was partly due to the
56
57 large amount of such data and also because some of the quality, particularly on
58
59 the audiotapes made it difficult to hear every word spoken. Critical incidents
60

1
2
3 or noteworthy sections were identified and these were then transcribed and
4
5 added to the summaries. In some domains where the main data source for a
6
7 particular line of investigation involved teacher talk, researchers elected to do
8
9 full transcriptions and analyses of videotapes. This is evident in the
10
11 Knowledge Integration paper in this set.
12
13

14
15
16
17 Classroom observations were recorded through field notes and video. The
18
19 video was summarized and critical incidents and noteworthy sections added in
20
21 a similar process to that used for the recordings of the teacher meetings.
22
23

24
25
26
27 Coding of the teacher meeting summaries and interviews resulted in a number
28
29 of themes emerging. Analysis has involved cross-referencing and triangulation
30
31 of themes in data sets from audio- and video-recordings of the teacher
32
33 discussions in the CPD sessions, teacher interviews and the portfolio
34
35 documents and has involved comparisons of data sets across the domains.
36
37

38 39 40 41 Discussion of findings 42

43
44
45 This introductory paper is intended to map out the ground for the papers that follow
46
47 where more specific findings will be reported. The findings that we report are
48
49 therefore in more general terms across the six domains of the project and describe the
50
51 constraints and affordances that we encountered.
52
53

54
55
56 Finding 1: The CPD programmes provided opportunities for teacher reflection and
57
58 learning.
59
60

1
2
3 *I really enjoyed turning up for the CPD sessions. The activities were good for getting*
4 *you thinking and working with like-minded teachers was a real bonus. You were*
5 *prepared to have a go at new ways of working, to reflect on what happened and refine*
6 *it so that it worked every time. I think all CPD should be like this.*
7
8
9
10
11
12

13
14 Lily, Final interview, June 2005
15

16
17 There are many challenges for developing effective CPD programmes in that such
18 endeavours need to provide regular and sustained opportunity for teacher reflection
19 and learning. The 1988 review of CPD effectiveness (Joyce & Showers) indicated that
20 programmes needed to be centred on classroom practice so that new practices could
21 be evolved and moulded from existing practice. Our approach was a move away from
22 the classic Joyce and Showers coaching approach, where an 'expert' supports the
23 development in the teacher's own classroom. Instead, we asked teachers to recognise,
24 collect and bring evidence from their own classrooms for analysis and reflection in
25 teacher meetings. This therefore placed a greater responsibility on the individual
26 teachers within the developmental process and provided an extra layer of reflection
27 and advice from their peers and this occurred through the professional dialogue at the
28 teacher meetings. This not only reduced the dependency on the expert coach, but
29 helped foster a teacher learning community in which collaborative endeavour
30 provided both the support and impetus for teachers to take risks once they returned to
31 their own classrooms (Hoban, 2000).
32
33
34
35
36
37
38
39
40
41
42
43
44
45
46
47
48
49
50
51
52

53
54 One noteworthy point was the positive attitudes and satisfaction of teachers with the
55 programmes. Teachers enhanced their acquaintance with the domain, their
56 pedagogical content knowledge, their practical teaching knowledge and their
57 sensitivity to students' understanding and progress. The socio-cultural practice that
58
59
60

1
2
3 the teachers engaged in through the CPD programmes played an essential part in
4
5 aiding teacher learning. Teachers appreciated getting constructive feedback from the
6
7 researchers, from their peers and from experienced teachers for that domain both
8
9 about the reported activities and about the collection of evidence. It should be noted
10
11 that in the beginning of the CPD program, teachers had difficulties in carrying out the
12
13 evidence-based approach. However, over the course of the programmes we observed
14
15 that it became a powerful means in creating the community of practice. Teachers felt
16
17 free to share with their peers' achievements and difficulties and to use these
18
19
20
21
22 opportunities as vehicles for professional growth.
23
24
25
26
27

28 Finding 2: The teachers initially found the evidence-based approach to CPD difficult.
29
30 They spoke about time constraints and possible problems of acceptability of new
31
32 approaches with colleagues in their schools. In later interviews, many had either
33
34 gained confidence to pursue their individual developmental goals or recognised that
35
36 the concerns they had were not as critical as they had first envisaged, but rather were
37
38 ways of protecting themselves in case they failed to make the changes they wanted in
39
40
41 their classrooms.
42
43

44
45
46 *Looking back, it hasn't been half as difficult as I imagined it would be to bring about*
47
48 *these changes in my classroom. I thought at the start I want to do this but what if I*
49
50 *can't find the time to do it. The idea of having to bring evidence was scary but, in*
51
52 *reality, its been the thing that has helped me see what I am doing and not doing to*
53
54 *help my students learn.*
55
56 *Amina, final interview June 2004*
57
58
59
60

1
2
3 The difficulties that many teachers face when introduced to new approaches in the
4 classroom is how to work these new ideas into their existing practice so that a
5 different overall practice emerges (Priestly & Sime, 2005). This is not a simple task as
6 it requires the teacher to understand the implications and likely effects of such
7 changes on their practice and on the learning of their students, as well as demanding
8 different behaviours from each of the parties. This can involve teachers reshaping
9 their own beliefs about what constitutes effective science teaching and learning,
10 especially if their new practice differs from that of their colleagues in school
11 (Cochran-Smith, 1994). Teachers are therefore challenged to justify not only to
12 themselves but also to their students, colleagues and other interested parties as to why
13 they are bringing in these new practices. As such, developing new practices is a risky
14 business and one that will call on teacher time and effort to ensure that they are not
15 only effective but seen as acceptable within the school context (Loucks-Horsely et al,
16 2003). Such developments frequently take place in environments where there are
17 competing priorities for teacher time and development of practice (Harrison, 2005).

18
19
20
21
22
23
24
25
26
27
28
29
30

32
33
34
35
36
37
38
39
40
41
42
43 Finding 3: Constructing the portfolios provided further opportunity for reflection,
44 discussion and learning for the teachers.

45
46
47
48
49
50 An essential task within the programmes was to introduce the idea of the portfolio so
51 that teachers' understood the role and nature of the portfolio and its contribution to
52 their professional learning, and had sufficient guidance about how to go about
53 constructing a portfolio. This was achieved by focusing on features in each domain
54 that indicated 'accomplished' practice, that is, practice that demonstrated an

1
2
3 understanding of teaching and learning in that domain. Teachers were thus able to
4 focus on evidence that showed their progress towards accomplishment in the domain
5
6 in which they were working and so the processes that they engaged in took a more
7
8 ipsative rather than comparative approach to their professional development. They did
9
10 not compete with one another but rather focused on their own learning journeys, while
11
12 at the same time often working collaboratively with peers to help them realize their
13
14
15 progress towards accomplished teaching in that domain.
16
17
18
19
20
21

22 The notion of 'learning through reflection' is central to the use of portfolios for
23
24 teacher development (Dinham & Scott, 2003), and is a recognised feature of
25
26 professional learning systems (e.g. Hoban, 2002, Loucks-Horsley et al 2003, Munby
27
28 et al, 2000). The selection of pieces of evidence for the portfolio is an important first
29
30 step towards reflecting on practice. For example, teachers can use resources they have
31
32 developed, student outcomes, video material etc to reflect on the effectiveness of their
33
34 practice and their own professional learning. Other researchers have shown that the
35
36 process of reflection in portfolio construction can be enhanced through peer
37
38 discussion and collaboration (Davis & Honan 1998, Grant & Huebner 1998, Lyons
39
40 1998, Shulman 1992). The provision of feedback, questions and different perspectives
41
42 by peers and mentors can strengthen the portfolio development process through
43
44 broadening the process of reflection, as Orland-Barak (2005) found when teachers
45
46
47
48
49
50
51 became more dialogic as they collaborated.
52
53
54

55 **Conclusions and Implications**

56
57
58

59 This paper focuses on the design of CPD programmes and highlights the need for
60
teacher reflection on their practices, beliefs and learning as an 'on-going' and vital

1
2
3 part of the CPD programme. It starts to unpack some of the complexities involved in
4
5 effective CPD programmes and focuses on how seeking and reporting on evidence of
6
7 practice helps teachers reflect on, and develop their practice. As such it will provide
8
9 messages that will be useful to CPD providers and those interested in teacher learning
10
11 as well as provide a tool kit of activities within each domain designed to promote
12
13 teacher learning and enhance practice.
14
15

16
17
18
19 The main findings were that the socio-cultural practice that was engaged in through
20
21 the CPD programmes played an essential part in aiding teacher learning. The teachers
22
23 needed to recognize good practice within a domain, make sense of its complexities
24
25 and understand the effects and synergies of various aspects of practice as they came to
26
27 find their own ways in establishing such practice. This approach was made possible
28
29 by the programme designs, which gave allowance for collaborative activity and
30
31 professional conversations, and the impetus derived from the collection, analysis and
32
33 reflection on evidence. Such ways of working took considerable more time than had
34
35 been envisaged at the start of the project as teachers needed to be involved in
36
37 planning, actioning and evidencing their own practice as well as analyzing and
38
39 reflecting on their practice and that of others. This has implications for CPD
40
41 providers since such programmes are costly in both time and funding, but also
42
43 because it signals strongly that teachers need strong support in the initial phases of an
44
45 evidence-based approach and this needs to be factored into any new programme.
46
47
48
49
50
51

52
53
54 Providing the opportunity to set up an iterative cycle of planning, trialling and
55
56 reflecting, where the essential features of scrutiny and guidance were effected in the
57
58 trusting environment of 'like-minded' colleagues enabled teachers to overcome their
59
60 own institutional hurdles to change. The processes involved in the evidence-based

1
2
3 approach helped teachers build a portfolio, and, more importantly, encouraged them
4
5 to undergo the change process from which their new practice evolved. The role of the
6
7 portfolio was to provide a process of evidence collection, discussion and reflection
8
9 that documented, supported and strengthened a teacher's changing practice. It fostered
10
11 an agency of change which helped the teachers gradually transform their classroom
12
13 practice within a specific domain.
14
15
16

17
18
19
20 The researchers from all six domains were experienced in working with teachers on
21
22 CPD programmes prior to this research but their focus previously had been on
23
24 producing activities to engage the teachers in understanding the ideas of the domain.
25
26
27 The work on this project took the materials that researchers had already produced and
28
29 developed the processes that aided teacher reflection and professional learning. It
30
31 enabled the teachers to start to move from translating the ideas of the domain into
32
33 practice to transforming their practice. It was not simply trying out some new ideas
34
35 within their existing practice but a change in practice in which the new ideas drove
36
37 their classroom approach. While the degree to which each teacher achieved this
38
39 differed, it was clear that the CPD programmes had a marked affect on their practice
40
41 as witnessed in their portfolio pieces, on video clips and in classroom observations.
42
43
44
45
46
47

48
49 The paper set reflects the varied and innovative ways in which the teacher
50
51 development has been achieved. Experimenting with an evidence-based approach was
52
53 aided by the cross-cultural element of this project. Working on a common approach
54
55 from two different perspectives enabled us to see the commonalities within our data
56
57 and so helped us unpick the essential elements from those that occurred through local
58
59 or sample preferences. This helped us clarify both the teacher development side and
60

1
2
3 research part of the project. The two country approach also allowed us to exchange
4
5 ideas and discuss the research background, data and interpretations more broadly than
6
7
8 we would have achieved working only with colleagues from similar backgrounds and
9
10 institutions.
