The Entitlement Approach – a case for framework development rather than demolition

Abstract

The article dismisses most of the objections previously forwarded in this journal by Khandakar Qudrat-I Elahi against Amartya Sen's framework for famine analysis: the entitlement approach. Instead, the article argues that even thirty years after the conception of the entitlement approach, it remains a potent framework for famine analysis, as illustrated by the recent 2005 famine. However, as contemporary famines are increasingly linked to factors that have hitherto received limited attention in entitlement analysis – conflicts, legal collapses and political struggles – the article calls for supplementary famine analysis on the meso and macro levels.

Introduction

In 1977, Sen forwarded a simple yet groundbreaking idea: what if we think of famine as a lack of access to food rather than a lack of food availability? This basic insight was developed into a more comprehensive famine framework, the entitlement approach, in Amartya Sen's famous book *Poverty and Famines: An Essay on Entitlements and Deprivation* from 1981. Its publication sparked much controversy and heated academic debate about the validity of the entitlement approach and the empirical evidence supporting the framework.

Some thirty years later, two things are painstakingly evident: the approach has yet to fully catch on in the famine prevention policy work of donor countries, international organisations and national governments alike; and the critique of the approach remains very much ongoing. Of course, debate and reflexivity is the very foundation of a dynamic social science tradition. Nevertheless, the discussion surrounding the entitlement approach has not always been productive, as it was largely based on misconceptions and straw men fallacies. Ravallion summed up the debate about Sen's entitlement approach by proclaiming that 'in retrospect, I do not think one could reasonably say that all of this debate has been insightful or interesting' (Ravallion 1997:1209). Jean Drèze argued – referring to the quality of some of the contributions – that the entitlement debate is likely to be of greater interest to psychologists than economists (Drèze 1999:5).

1
2
3
4 Living up to the agenda of opening up many new areas of debate about vital
5 development issues, *the Journal of Development Studies* published a critique of the
6 entitlement approach by Khandakar Qudrat-I Elahi in May 2006 (JDS 2006:541-557).
7 The idea of revitalising the discussion of the entitlement approach is indeed
8 commendable in as much as it is currently both underutilised and seems ripe for a
9 brush-up in terms of being applied to more contemporary famines – a point I will further
10 elaborate on in the course of this article. However, the quality of the published article is
11 such that it does not distinguish itself sufficiently from many of the earlier critiques to
12 constitute a constructive platform for augmentation or further development of the
13 famine analysis discipline. Part of the reason is that the article is conspicuously silent
14 when it comes to the question of how to move forth. And part of the reason is Elahi's
15 obsession with analysing the entitlement through an ethical lens as a philosophical
16 approach. Therefore, while I sympathise with Elahi's effort to inject fresh ideas and
17 critiques into the entitlement debate, having devoted some time myself to the analysis
18 of famine in general and Sen's entitlement approach in particular, I feel obliged to
19 address some of the shortcomings and misunderstandings presented in the article.

32 Firstly, allow me to familiarise the reader with the essence of Sen's entitlement
33 approach.
34
35

36 **Presentation of Sen's entitlement approach**

37 Sen's entitlement approach broke with the traditional view of famine analysis referred
38 to by Sen as the Food Availability Decline approach (henceforth the FAD approach).
39 The FAD approach was a response to the Malthusian focus on population growth as a
40 problem in itself. Being conceived in an era (mid-nineteen century) when significant
41 agricultural advances were made, the FAD approach contained an optimism not
42 reflected in the Malthusian tradition: mankind was not the passive victim of nature's
43 own checks and balances. Instead, the approach was concerned with means of
44 ensuring sufficient food availability. According to the FAD approach, the cause of
45 famine was that food production was concentrated geographically or in time. Some
46 countries (or regions) did not have enough food during particular periods of time to
47 prevent famines. Natural disasters, inadequate production techniques or lack of
48 infrastructure could all contribute to the lack of food. Accordingly, the approach focused
49 on food production capacities.
50
51
52
53
54
55
56
57
58
59
60

1
2
3
4 Sen's critique of the FAD approach did not signal a return to the Malthusian tradition.
5
6 On the contrary, Sen distanced himself from both approaches by constructing an
7
8 approach in which famines were neither reduced to nature's own checks and balances
9
10 nor the result of an insufficient production capacity; instead, famines were to be
11
12 analysed in a socio-economic context. His approach was thus a refutation of the well
13
14 known Malthusian pessimism as well as a dismissal of what Sen described as
15
16 'Malthusian optimism': as long as there is enough overall food in the economy, there is
17
18 no reason to worry (Sen 1993:36).

19
20 Sen defines the entitlement of a person as 'the set of alternative commodity bundles
21
22 that can be acquired through the use of the various legal channels of acquirement open
23
24 to that person' (Drèze/Sen 1989:23; Drèze/Sen 1990a:38). A person's entitlement
25
26 depends on two factors: his initial endowment and the E-mapping specifying the set of
27
28 alternative commodity bundles that can be obtained given the initial endowments. The
29
30 E-mapping will often depend on the exchange entitlement that describes the alternative
31
32 commodities that can be obtained in exchange for the endowments, but it can also be
33
34 influenced by changes in production or direct transfers. An adverse change in the E-
35
36 mapping can therefore be caused by an endowment loss, failure of production,
37
38 exchange failure and transfer failure. Entitlement failure occurs when it is not possible
39
40 for a person to acquire commodity bundles with enough food to survive (Sen 1981:51).

41
42 By including the E-mapping in the entitlement approach, Sen attempted to improve the
43
44 understanding of poverty and famine by taking a more disaggregated perspective. He
45
46 thereby acknowledges the massive economic activity usually taking place in
47
48 impoverished households at a disaggregate level. The change in income transfers
49
50 among the poor themselves is of paramount importance in famine situations. Hence, a
51
52 famine does not occur because of lack of food availability but from a wide variety of
53
54 unfavourable changes in the E-mapping and endowment variables such as rising food
55
56 prices, falling wages, falling cash crop prices and so forth. Access to food is not merely
57
58 reduced to an economic question but 'depends on the legal, political, economic and
59
60 social characteristics of the society in question and the person's position in it' (Sen
1981:46). Sen does not deny that food availability affects many of the factors included
in the E-mapping – it does – merely that the central problem is the change of
entitlement (Sen 1977:34). Through a lovely double negation, Michael Watts (2000:60)
notes that 'Sen is concerned to demonstrate that food supply is not unimportant.'

Instead, the real danger lies in lulling governments into a soporific complacency by focusing exclusively on food availability. Famine prevention must therefore be concerned with the protection of entitlements rather than concerned with food availability per se.

At this point, some might be disappointed. The entitlement approach is not based upon any notion of moral values about what a person should ideally be entitled to; it is simply an analytical tool. Sen (1981:155) clearly underlines that the entitlement term is without any ethical considerations of legitimate claims: 'A person's ability to command food – indeed to command any commodity he wishes to acquire or retain – depends on the entitlement relations that govern possession and use in that society. It depends on what he owns, what exchange possibilities are offered to him, what is given to him for free, and what is taken away from him.' The descriptive quality of the entitlement approach is absolutely necessary in order to produce what Sen (1981:162) refers to as a 'general approach for analysing famines rather than one particular hypothesis about their causation.' In his critique of the entitlement approach, Devereux (2002:1) also notes that the entitlement concept is descriptive rather than normative and that entitlements derive from human legal rights rather than moral or human rights.

Commenting on Elahi's critique of the entitlement approach

In an article entitled *Entitlement failure and Deprivation: a Critique of Sen's Famine Philosophy*, Elahi forwards a critique against the conceptual foundation of the entitlement approach in the form of four specific objections that are emphasised in his abstract:

- a) Sen unduly criticises the FAD approach. The FAD is indeed fully capable of explaining movements in food prices.
- b) Sen's *exchange entitlement* is inconsistent with the principles of capitalism, since this economic system operates on the conceptual and legal approach of voluntary exchange.
- c) In as much as food is considered an entitlement commodity, other basic necessities of life, such as healthcare and education, could then claim the same status.
- d) Finally, it is argued that the approach is founded on a hidden hypothesis that income distributions in non-communist states are economically and politically optimal.

1
2
3
4
5
6 Despite the preoccupation of many distinguished scholars with the entitlement
7 approach and several academic debates over the past thirty years, the four listed
8 objections have not previously been uncovered, Elahi's argument goes, because the
9 previous critique has all appeared 'too uncritical to pinpoint the logical lacuna in Sen's
10 famine thesis' (Elahi 2006:542). I will address each of these objections in turn, but
11 allow me briefly to return to the title of Elahi's article. In the preceding thirty years,
12 Sen's entitlement approach has been perceived to be a specific hypothesis or a theory
13 of famine causation, but not even the harshest critics of the entitlement approach have
14 ever claimed that Sen had developed a famine philosophy. A Google search reveals
15 that the term *famine philosophy* is anything but a conventional term – it has only been
16 used by Elahi himself. I would argue that Sen's approach to famine analysis does not
17 constitute a philosophical direction, as it has little to do with belief systems and ethical
18 principles. Instead, the entitlement approach is an analytical approach, making it
19 possible to deduce conclusions with moral implications; one of those implications, for
20 instance, relates to the inadequacy of relying on legal structures in famine situations.
21 The title therefore already appears to merit some reservations with respect to the
22 validity of the criticism that is about to be forwarded in the main text.

35 To claim that the approach is philosophical in that 'it connects the critical ideas of all
36 four aspects of our social life – economic, legal, political and social' (Elahi 2006:556)
37 does not appear to be a valid argument. The mere connecting of different strands does
38 not constitute a philosophical direction – in effect, most analytical approaches strive
39 towards being able to encompass various socio-economic aspects. The fact that Elahi
40 has – fallaciously as I will expand in the following – converted an analytical approach
41 into a famine philosophy might account for some of the misconceptions in his article.
42 Note that I fully sympathise with many of the moral issues Elahi raises in his article; it is
43 not hard to applaud his concern for questions of inequality, poverty and famine. Yet
44 contrary to Elahi's belief that socio-economic issues of poverty and famine 'must be
45 studied from the perspectives of moral and political philosophy' (Elahi 2006:556), I
46 would argue that it is imperative that these issues are studied using a coherent
47 analytical approach and that such analysis enhances rather than hinders subsequent
48 moral and ethical judgements.

On Elahi's first objection

1
2
3
4 Elahi claims that Sen unduly criticises the FAD approach and argues (Elahi 2006:551)
5 that 'if the FAD approach can explain food price behaviours in all supply situations,
6 slump, normal, and boom, then Sen's complicated famine analysis naturally loses its
7 intellectual appeal'. The contention that the entitlement approach becomes redundant if
8 FAD can explain food price behaviours in supply situations is flawed from two
9 perspectives: firstly, Elahi's own admission of a significant speculative element in food
10 prices makes the actual decline of food availability a less determining factor in price
11 formation. On the other hand, Sen's entitlement approach is particularly well-equipped
12 to include price movements and (more importantly) changes in the relative prices with
13 respect to essential foods, which is a determining factor in famine vulnerability for many
14 households. Elahi characteristically abstains from providing any empirical evidence that
15 would either demonstrate the inadequacy of Sen's entitlement approach in capturing
16 price behaviours or display the superiority of the FAD approach in predicting terms of
17 trade. There is no justification for claiming that Sen, a Nobel Laureate in economics,
18 'ignores the fact that speculative – not actual – supply and demand forces determine
19 prices in market economy in the short run' (Elahi 2006:555); especially considering that
20 Sen very explicitly argues that some famines are greatly influenced by speculative
21 activities. For instance, Sen emphasises the important role played by professional
22 speculators in the Bengal famine of 1943 (1981:159). That is why famines are known to
23 have occurred in the midst of soaring prices but with no radical drop in food availability
24
25
26
27
28
29
30
31
32
33
34
35
36
37

38 Secondly, and more importantly, famine approaches do not aspire to explain *food price*
39 *behaviours* but to explain *famine*, which often entails a disaggregated and
40 multidimensional perspective distinguishing between different social groups and
41 geographical areas. FAD is an inept approach for such disaggregated analysis. By
42 replicating Sen's more eloquent formulation, starvation statements are about the
43 relationship of persons to the commodity – not the commodity itself. Price movements
44 are often important components in a famine, but a sole focus on terms of trade will only
45 offer a partial picture of the entitlement pattern. One of the strengths of the entitlement
46 approach is that it uncovers the famine victims' actual needs, which might not be
47 reflected in the market; without a certain level of income, it is not possible to generate
48 enough demand in the market to keep food in the region. During the Ethiopian famine
49 of 1974, for instance, food prices in the Wollo region remained largely the same, while
50 food actually moved out of Wollo to neighbouring cities driven by the failure of the
51 prices to reflect the actual demands of the population (Sen 1981:94).
52
53
54
55
56
57
58
59
60

On Elahi's second objection

Elahi's second objection against the entitlement approach is based on the rather bombastic claim that 'Sen's idea of entitlement contradicts the fundamental principle of market economy' (Elahi 2006:552). Elahi argues that the term *exchange entitlement* is inconsistent with the principles of capitalism and that the whole entitlement approach is 'tantamount to the repudiation of capitalism and advocacy for the revival of socialism' (Elahi 2006:553). The reason is that the market is based on voluntary exchanges and that Sen's idea of food entitlement is inconsistent with these voluntary exchanges. I strongly disagree with this contention. Every capitalist society builds on institutional arrangements that are not merely based upon voluntary principles of economic exchange. They provide their citizens with certain entitlements (often in the form of a minimum of pension, education, healthcare, unemployment benefits and so forth) and expect certain obligations (income tax, VAT, military service and so forth). The state itself is the most extreme institutional arrangement that serves the dual purpose of forming and controlling the environment for voluntary exchange but at the same time often intervenes in the market to improve market institutions or to pursue political goals (equity, poverty reduction and so forth).

In addition, Sen's use of the term exchange entitlement does not contain any ethical considerations of legal rights to food (as one might find in a famine philosophy); instead, Sen clearly defines exchange entitlements in purely analytical terms as the set of alternative bundles of commodities that a person can acquire in exchange for what he owns (Sen 1981:3). Sen directly asserts that the measurement of poverty should *not* be an ethical exercise but primarily a descriptive one (Sen 1981:23). As such, entitlements do not contradict voluntary exchange; the concept simply does not contain any normative notion of food entitlement at the expense of voluntary exchange.

Furthermore, Elahi perceives it to be a contradiction that Sen's 'famine philosophy' accepts that endowments created by the market are legitimate, while at the same time holding the system responsible for failing to meet the food entitlement of poor people (Elahi 2006:553). However, Sen's position is exactly that endowments are not legitimate in a Nozickian sense; instead, he holds that starvation deaths reflect legality with a vengeance. This has been pointed out repeatedly not just by Sen but other scholars as well; as recently as 1997 Ravallion – looking back at some of the critiques

against the entitlement approach – specified exactly this point: ‘The term “entitlement” has also generated some confusion. The term carries a normative connotation, although the intended meaning in this context is entirely positive; Sen (1981, p. 2) was careful to point this out, and specifically to distinguish his usage of the word from the normative meaning found in, for example, Robert Nozick’s (1974) “entitlement theory of justice” (Ravallion 1997:1210). Endowments created by the market might be legitimate in a legal sense, but by analysing famines through the entitlement approach, one can conclude that widespread suffering and deaths can take place in an otherwise fair legal approach. Legitimacy then becomes a moral question that lies beyond the analytical approach.

On Elahi’s third objection

The third objection against the entitlement approach is caused by the same misconception as above. Elahi rightly – and hardly surprisingly – argues that the poor might not be able to afford sophisticated healthcare services in some societies, but he then argues that ‘according to Sen’s theory, they are not entitled to have this service, because it is not included in their endowment set’ (Elahi 2006:554). Again, this confuses Sen’s analytical approach with ethical reflections of whether the poor ought to enjoy access (and to what extent) to education, employment, healthcare, housing etc. Notwithstanding the fact that the entitlement approach is an approach for famine analysis (and not for poverty alleviation or public policy targeting in a broader sense), the entitlement approach is indeed able to analyse whether individuals do in fact have access to sophisticated healthcare exactly because the E-mapping includes an array of different channels including government healthcare provisions. What policy conclusions to draw from such an analysis is an open question. And on that note, it is worth remarking that sophisticated healthcare services are in fact restricted to relatively few in most societies – even in wealthier societies.

On Elahi’s fourth objection

As regards the last point, Elahi argues that ‘the entitlement approach is founded on a hidden hypothesis that income distribution in the non-communist state is economically and politically optimal. This hypothesis, too implicit to attract readers’ attention must be controversial beyond any shadow of doubt’ (Elahi 2006:556). Elahi might have a point here. Indeed, the hypothesis must be very implicit, because I have not seen any arguments in Sen’s work that could be even remotely interpreted in that manner. Why

1
2
3
4 the entitlement approach should presume an income distribution that is economically
5 and political optimal (optimal in what way?) remains a mystery that Elahi fails to get
6 across. In addition, such an optimal income distribution in non-communist states
7 resonates rather poorly with Elahi's previous claim about the entitlement approach
8 being a repudiation of capitalism and advocacy for the revival of socialism.
9
10
11
12

13 On Elahi's other claims

14
15 Aside from the four objections above that were emphasised by Elahi himself in the
16 abstract and his conclusion, his article also contains other debatable claims that must
17 be addressed briefly.
18
19
20
21

22 Elahi contends that economic and legal systems can be described objectively and
23 descriptively, while social and political systems cannot be encompassed in a
24 descriptive approach on the grounds that they are unavoidably prescriptive and
25 normative (Elahi 2006:553). Following this logic, Sen's entitlement approach cannot
26 merely be an analytical approach, as it also seeks to include social and political factors.
27 A distinction between social and political systems on one side and economic and legal
28 systems on the other is bound to be artificial: social and political factors
29 create/shape/destroy economic and legal systems and vice versa. Upholding
30 distinctions can be merited from an analytical perspective but not as an ontological
31 position, which contends that social and political systems are prescriptive, while
32 economic and legal systems are descriptive. To postulate that social and political
33 factors cannot be analysed descriptively goes against the basic fundamental principles
34 driving much of the research in political science, sociology and anthropology.
35 Entitlements derived from state contributions (mainly political) and from family
36 reciprocity (mainly social) can certainly be analysed just as well as entitlements derived
37 from the market (mainly economical).
38
39
40
41
42
43
44
45
46
47
48
49

50 In another section, Elahi blames the E-mapping for including social security provisions,
51 because 'these social security provision are available, to a varying degrees, only in
52 advanced democratic countries of the West, which naturally questions whether the
53 entitlement approach applies to famines that occur, or had occurred, in third world
54 countries' (Elahi 2006:550). This line of reasoning is flawed on at least two levels: (i)
55 including a rarely used channel in a variable hardly invalidates the whole approach.
56 The entitlement approach with its E-mapping can obviously also be applied in cases

where public provisions are non-existent exactly because the E-mapping includes a diverse range of other channels. (ii) Government provisions in developing countries are in fact widespread in most famine situations in the form of food distribution, fair price shops or public works. Every single Poverty Reduction Strategy Paper I have come across includes policies for social security provisions.¹ It could even be argued that the public policy expenditure side plays a much more important redistributive role in developing countries due to their limited logistical capacity for implementing a progressive taxation system based on direct taxes (Burgess and Stern 1993). Social security systems in developing countries rely less on voluntary insurance systems with an emphasis on capability expansion and more on state provisions prioritising the protection of vulnerable groups from external shocks. In famine situations, these provisions might be inadequate, belated, suffer from problems of leakage and corruption, or they might be used politically in a counterproductive manner, but claiming that they are available only in developed countries is simply incorrect. In famine situations, aid from international NGOs – often channelled directly through the government – further enhances the role of public provisions.

In the article, it is also asserted that 'the entitlement approach contributes to the process of landlessness and pauperization' (Elahi 2006:554). Aside from seemingly exaggerating the political impact of the entitlement approach, the statement builds on the – rather unfounded – inference that public policy based on the entitlement approach would force subsistence peasants to liquidate their assets in order for them to receive public assistance. Such serious accusation must be founded on a minimum of empirical evidence. Public policy could certainly be construed in a manner providing perverse incentives, but there is nothing in the entitlement approach that could be responsible for spurring such a type of public policy.

Elahi also argues that 'the situation of starvations eliminates all kinds of choices' (Elahi 2006:556), which ought to invalidate the entitlement approach, because it builds on neoclassical theory with individual choice as the guiding principle. Aside from noting the ambiguity of having an approach that on one side builds on neoclassical economic theory and at the same time supposedly should contradict the fundamental principles of market economy, Elahi is once more on troublesome ground when he claims that starvation eliminates all kinds of choices, as the many choices faced by starving people have both been empirically observed and can be explained theoretically. Ravallion

1
2
3
4 (1997) has approached famines from an economically founded risk and uncertainty
5 assessment where choosing to starve could be a step in a rational long-term survival
6 strategy. Devereux (2001) has conversely emphasised what he refers to as 'social
7 vulnerability', where social units (often families) are forced to make choices about
8 whom to sacrifice in order for the unit to survive. Despite differences in perspectives,
9 both contributions highlight the aspect of choice during famine.
10

12
13
14

15
16 Elahi claims that starvation by connotation is associated with an involuntary endurance
17 of hunger, and he uses this to criticise Sen for being unclear and missing this main
18 point, because Sen has argued that starvation can both be caused by a person being
19 unable to command enough food or caused by a person not using his ability to avoid
20 the situation (Elahi 2006:549). Nonetheless, the connotation applied by Elahi is neither
21 shared by the *Encyclopaedias of Medicine* nor the dictionaries of *Merriam Webster* and
22 *Oxford* (nor any other I have come across), where there is no reference whatsoever to
23 the aspect of involuntariness with respect to starvation. In addition, one might wonder
24 how Elahi would describe the craving sensation felt by the famished mother who
25 voluntarily surrenders her own food to feed her severely malnourished children; or the
26 sensation felt by the subsistence farmer who chooses to starve now rather than to
27 harvest early and jeopardise the household's existence in the long run.
28
29
30
31
32
33
34
35

36
37 The final point I will address here is Elahi's postulation (2006:555-556) that Sen's
38 'entire analysis is founded on posterior food supply situation.' In as much as Sen has
39 spent 300 pages explaining the perils of focusing on food supply, I would think this
40 claim requires no further repudiation.
41
42
43
44

45 **Developing the entitlement approach**

46
47 Let me hasten to admit that there is indeed scope for analytical improvements of the
48 entitlement approach. The crux of the matter is that this does not even remotely lead
49 me to concur with Elahi's conclusion (2006:556) that 'Sen's innovative idea has added
50 little to a penetrating analysis, let alone a solution to this disgraceful human tragedy.'
51
52 On the contrary, I find Sen's entitlement approach to be an extremely potent approach
53 to famine analysis, and I regret when it falls short of being fully utilised in the general
54 policy work on famine.

The 2005 Niger famine provides a case in point for the continued relevance of the approach as well as being illustrative of the lack of adherence to the approach's basic principles in much practical famine policy work.ⁱⁱ The famine, it seems, was caused less by a food availability decline and more by an increase in the price of staple foods. According to the USAID's Famine Early Warning System Network (FEWS NET), the national cereal production was only 11 percent down from the five year average – and could have been covered by a mere 3% increase in Niger's normal cereal imports (IRINnews 2005/08/09). The production was even above the relatively poor 2000/1 season, which did not lead to a major food crisis (Gobler-Tanner 2006:1). Moreover, the same crop failure was experienced throughout the Sahel region, but no other country faced a food crisis of famine proportions (HPG 2005:1). Much of the reason for the 2005 famine was Niger's rigid economic structures that pressured people to sell grain to traders when prices were at their lowest and to borrow grain from them when prices were at their highest. These unfavourable terms of trade led to exchange entitlement collapses for many households in the Southern districts. The problem in Niger was not an absence of food – there was indeed food in the market – people could simply not afford to buy it (Mousseau & Mittal 2006:11).

The famine was allowed to develop because both the government and much of the international community seemed to rely on aggregate measures of food production. The FEWS early warning system – with an emphasis on drought and weather-related factors rather than socio-economic factors – failed to anticipate the severity of the famine. As late as December 2004, FEWS NET described the overall regional food situation in Sahel as fair in terms of availability and access with only localised problems (HPG 2005:3). The exponential increases in feeding center admissions across the Southern regions of Niger (as documented by Médecins Sans Frontières) were not caught in an early warning system based mostly on vegetation and rainfall indicators. Thus, the 2005 Niger famine underlines the continued need to more thoroughly incorporate the focus of the entitlement approach regarding socio-economic access to food in early warning systems.

My argument is rather that many contemporary famines (the Niger famine being one of the exceptions) involve slightly different dynamics that make it necessary to rely on additional analytical tools to strengthen the entitlement analysis. I will focus on three such dynamics here.

1
2
3
4
5
6
7
8 Firstly, there needs to be increased focus on the ties between conflict and famine.
9 Empirically, contemporary famines appear to be strongly correlated with the existence
10 of civil war. The reason is not only that conflict generates more famines now compared
11 to thirty years ago, but rather, that fewer contemporary famines take place outside the
12 realm of conflict and war. FAO (2005:5) reports how conflict has moved up to become
13 the most common cause of food insecurity. Another recent FAO report (Kidane et al.
14 2006:22) estimates that food access was constrained in 2001 by political or armed
15 conflicts in more than half the countries in Sub-Saharan Africa, most commonly
16 because warring parties used food directly as a weapon or otherwise destroyed local
17 food supplies and capacities to produce food.
18
19
20
21
22
23
24

25
26 Secondly, an entitlement analysis needs to address the collapse of legal structures.
27 The formal legal system has limited applicability in many famine-prone countries, and
28 the importance of socially enforced rules might be greater than Sen had envisaged in
29 1981. With up to 90% of the population in parts of Sub-Saharan Africa relying on
30 customary legal relations, attention to informal structures seems particularly warranted
31 (Woolcock & Sage 2005:20). In addition, most contemporary famines seem to coexist
32 with rapidly changing or collapsing formal and informal legal arrangements, which calls
33 for the inclusion of these legal arrangements as dynamic practices rather than as static,
34 exogenous structures.
35
36
37
38
39
40
41

42 Finally, increased attention should be devoted to understanding famine dynamics at the
43 political level. The entitlement approach, with its liberal assumptions and micro-level
44 perspective, is somewhat ill-equipped to understand the deliberate use of famine as
45 part of a political strategy. With FAO (2005:6) noting that the proportion of food
46 emergencies that can be considered man-made has increased over time from 15
47 percent in the period 1986-91 to more than 35 percent between 1992 and 2003,
48 understanding dynamics at the political level has become an increasingly indispensable
49 component of famine analysis.
50
51
52
53
54
55

56 It should be emphasised that my point is not that famines were previously isolated from
57 the effect of politics, war and the breakdown of formal legal structures.ⁱⁱⁱ It is rather that
58 famines have become more directly linked to civil war, the absence or downright
59
60

1
2
3
4 breakdown of legal structures, and political manipulation. Today, there are few famines
5 that do not involve these features, and the socio-economic context surrounding the
6 famines presented in Sen's *Poverty and Famine* book is somewhat uncharacteristic of
7 contemporary famines. In none of the empirical examples that Sen used to show the
8 superiority of the entitlement approach – the 1943 Bengal famine, the 1974
9 Bangladeshi famine, the 1972-1974 Ethiopian famine and the 1971-74 Sahel famines –
10 did these three factors stand out. If Sen were to choose four famines today, the
11 chances of him picking four famines in which these features do not dominate would be
12 nil.
13
14
15
16
17
18
19

20 Allow me to elaborate further on how to expand the entitlement analysis to better
21 address these three characteristics of modern famines
22
23
24

25 The entitlement approach and conflict

26
27 Despite the recent surge in conflict-related famines, scholars claimed long ago that
28 Amartya Sen downplayed the role of war. Nolan (1993:21) notes that 'the areas worst
29 affected by famine in both the 1970s and the early 1980s were those also worst
30 affected by warfare.' And yet, Nolan argues, wars are grossly overlooked in Amartya
31 Sen's famine analyses. Kula's (1987) main argument in his article is that the real
32 reason for most famines is 'war and its complicated politics, which affect the supply
33 system as well as creating a decline in entitlements' (Kula 1987:112). These views
34 have been summarised under the heading, a 'military famine thesis' by Jenkins &
35 Scanlan (2001).
36
37
38
39
40
41
42

43 The strong connection between conflict and famine appears to indicate that Nolan &
44 Kula were correct in claiming that Sen downplays the role of conflict and war. The
45 words 'conflict and 'war' do not even figure in the subject index in *Poverty and*
46 *Famines*. Although, the impact of wars can be caught in the entitlement approach (war
47 often leads to an immediate collapse of entitlements), it might be argued that such a
48 powerful event calls for a more direct inclusion in an analysis than the indirect influence
49 through the entitlement-variable. According to von Braun et al. (1998:3), of the 21
50 identified famines in the period 1970-1998, 15 were at least partly triggered by war.
51 Note, however, that this says little of the strength of the link between war and famine –
52 it merely indicates that when a famine occurs, war is likely to be at least partially to
53 blame. By relying on multivariate regressions, Jenkins & Scanlan (2001) find some
54
55
56
57
58
59
60

1
2
3
4 interesting impacts of different proxies for militarisms on two different measures of food
5 security: calories per capita and child undernutrition. With respect to food supply, the
6 change (1970-85) in arms imports as percentage of GDP enters highly significantly with
7 the expected negative sign in all regressions. However, child undernutrition was found
8 not to depend on that variable, but rather on a proxy for genocide/politicide that
9 displayed equally strong attributes (highly significant with the expected negative sign).
10 This could indicate that military build-up (and possibly war) affects food production but
11 not as such vulnerability to hunger; however, in genocidal environments (where legality
12 is undermined and state aggressions are targeted at particular ethnic or political
13 groups), the effect on hunger vulnerability is felt directly. Howard-Hassmann (2005)
14 points to the connivance of famines as a weapon of war: if a government starves its
15 people to death rather than actually murdering them, it can pretend to the outside world
16 that the deaths were accidental rather than deliberate. A newer strand of famine
17 literature thus examines the rationale and feasibility of encompassing famine crimes in
18 international law (Marcus 2003).
19
20
21
22
23
24
25
26
27
28
29

30 In the case of war, the collapse of legal structures appears to cause the greatest
31 suffering. Kula (1987), de Waal (1993) and von Braun et al. (1998:20-25) describe
32 some of the numerous ways that war can contribute to famine: through transfers of
33 food to the army, inflationary pressure from the war, through the shortage of labour
34 caused by enrolment to the army and war casualties, and through infrastructural
35 breakdown. By far the greatest contributor to modern famines, however, is the looting
36 and raiding of impoverished villages, often in connection with civil wars. This
37 'systematic asset-stripping' – as de Waal (1993:38) articulates it – has been a major
38 contributor to famines on the African continent: in the former Zaire, Sudan, Rwanda
39 and Somalia. War by itself is not a sufficient condition for famine. Indeed, even though
40 – according to Kula (1987:113) – the British forces during World War II had the best
41 food available and the rest of the population was put on a very basic diet, Sen reports
42 that in that period, the British life expectancy rate at birth actually rose substantially
43 compared to other decades (Drèze/Sen 1989:180). This anecdotal finding further
44 supports Jenkins & Scanlans' (2001) result that military build-up and war affects the
45 overall supply of calories but does not seem to have an impact on hunger. In the
46 war/famine relationship, legal/institutional collapse together with some political interest
47 in upholding the famine must be included as the most important factors.

3
4 Sen was therefore correct in arguing that the famines included in his book occurred in
5 societies with legal structures intact, but perhaps he failed to consider or anticipate how
6 most recent famines have coexisted with some type of violation of legality during war.
7 This, however, brings the discussion to the entitlement approach's reliance on legal
8 structures, which will be discussed in the subsequent section.
9
10
11
12

13 14 The entitlement approach and legal structures

15 In the context of modern famines, one of the key challenges is to capture the collapse
16 of formal and informal legal structures in the entitlement approach. In the approach's
17 original conception, entitlements were based on acquirements through formal legal
18 structures. These legal structures might not even be present in some developing
19 countries; or to the extent they are present, they could still be very poorly defined,
20 arbitrary and likely to be violated in extreme situations such as war and famine. If the
21 country is characterised by deep social cleavages or even in a civil war, this will be
22 even more so. The problem with relying on legal structures was not unfamiliar to Sen,
23 as he acknowledged that there can be a good deal of vagueness on property rights and
24 related matter in pre-capitalist societies, which would cause 'fuzzy' entitlements (Sen
25 1981:48-49).
26
27
28
29
30
31
32
33

34
35 The legal limitation could be argued to be a logical consequence of his approach – and
36 to a certain extent a useful one. Gore (1993) and Gasper (1993, 1997) describe how
37 the approach – at least in part – was developed as a response to Nozick's principles of
38 moral entitlement, which built on the sanctity of individual's possessions and the
39 protection of property rights regardless of consequences. According to their
40 interpretation, Sen's approach is not only a critique of the previous FAD approach but
41 also a moral critique of Nozick's possessive individualism. The fact that ILO financed
42 *Poverty and Famines* makes their interpretation even more plausible; ILO would of
43 course be very interested in counteracting Nozick's liberalistic views. Sen treats legal
44 structures as an independent variable and shows that within such structures,
45 destitution and famine can take place. Sen ends *Poverty and Famines* with exactly that
46 point: 'Starvation deaths can reflect legality with a vengeance' (Sen 1981:166). Yet,
47 although the formal legal system is indeed an important institution in converting
48 available food to food entitlements – it is not the only institution. Legal, nominal access
49 to entitlements might not be sufficient to prevent entitlement failure due to other socio-
50 economical structures that might hamper such access. Entitlement failures and famine
51
52
53
54
55
56
57
58
59
60

1
2
3
4
5 could also result from a shift in the practice of law, the customary laws, or be a product
6 of socially enforced rules. The formal legal systems in many African countries have
7 failed to integrate the customary laws, and the formal systems remain inaccessible for
8 the majority of the population. Kane et al. (2005) describes how the informal customary
9 law is more important for many people in developing countries as opposed to the legal
10 structures of civil law, which are limited to the relatively few. Customary law is usually
11 defined as a type of established pattern of behaviour within a particular social setting
12 that is perceived to be law by the relevant actors and that therefore lead to certain legal
13 practices that can be objectively observed. Access to resources in African countries is
14 often determined less by individual property rights and more by ownership relations
15 based on ethnicity or seniority for groups, communities and tribes rather than
16 individuals.
17
18
19
20
21
22
23
24

25
26 Gore (1993:449) provides an empirical example of food scarcity in Ghana (in the
27 1970s) that not only affected the E-mapping through higher prices but also through the
28 existing moral rules in the society where being a regular customer determined whether
29 or not it was possible to buy at given prices. A somewhat similar argument is presented
30 by Woldemeskel (1990) with reference to the Ethiopian famines in the 1970s. At that
31 time, having nominal legal access to land did not enable you to cultivate it. The
32 agricultural relations were constructed in such a manner that the state was provided
33 with the real or possessory right to land (Woldemeskel 1990:493). As such, the
34 peasants might have had de facto access to endowments, but they lacked the
35 institutional licenses to transform the endowment into food. The mapping was
36 determined by the practice of law rather than by the nominal legal rights. Both of these
37 examples point to the insufficiency of relying solely on formal legal channels of
38 acquirement.
39
40
41
42
43
44
45
46
47

48
49 In 1989, Sen introduced the term *extended entitlement*, which he defined as 'the
50 concept of entitlements extended to include the results of more informal types of rights
51 sanctioned by accepted norms of legitimacy' (Dreze/Sen 1989:11). There is no doubt
52 that informal rules and social norms play a decisive role in understanding famine but
53 Sen's own application of the term is quite similar to a two-stage analysis (inspired by
54 economic analysis), whereby he first determines the household's entitlement set and
55 then the allocation of food within the household (Drèze/Sen 1989:79). The original
56 entitlement term is used in the first part of the analysis, while the 'extended entitlement'
57
58
59
60

1
2
3
4 is used in the second part. Sen has thereby really only included part of the informal
5 institutions in the analysis; for instance, the role of religiously induced informal rules at
6 a more aggregated structural level is overlooked. Such a static two-stage analysis also
7 leaves the dynamics of the interplay between different types of rules unanalysed. Sen
8 has therefore rightfully been accused of not accepting the full consequences of
9 explicitly introducing social conventions and norms in the entitlement mapping (Leach
10 et al. 1999:233). Gore (1993:429) even argues that Sen 'ignores how legal rules work
11 in practice and downplays the way in which socially enforced moral rules constrain and
12 enable entitlement.' Barbara Harriss-White's (1990:351-424) analysis of gender
13 relations in situations of hunger and famine, for instance, benefits from a broader
14 analytical perspective that is capable of incorporating impacts of patriarchal
15 discrimination despite the article's strong quantitative base. Michael Watts, while being
16 very supportive of the approach in general, also argues (2000:61) that the E-mapping
17 should be 'much more complex and dynamic (involving all manner of social, cultural,
18 institutional, and collective actions beyond the entitlements discussed by Sen).'

Osmani (1991:591) acknowledges that 'the question of legality creates problems for
the entitlement approach' but argues further that if the entitlement set was not based
on acquirement through legal structures, the set would be indeterminable because one
could always – by means of violence – extend his/her set of entitlements. These
structures do not need to take the form of formal legal institutions, and in a later article
Osmani (1995:254 explicitly recognizes the need to take a broader view on legality 'to
mean conforming to established social norms and practices, and not merely to what is
sanctioned formally by the state.' Still, this view treats legal structures as exogenous
variables with less consideration to how the structures institutionalise themselves, how
they are transformed, and the conditions under which they disintegrate. Woolcock &
Sage (2005) argue that discussions of legal rules too often ignore the fact that they are
social constructions – cultural and normative understandings establishing and
legitimising appropriate behaviour. Instead of starting from a 'rule of law' model from
which deviations can be measured and targeted, it may be more helpful — and realistic
— to 'assume anarchy'. Legal anarchy with the collapse of both formal and informal
legal structures appears to be an integral cause of many contemporary famines.
Seeing that legal systems continuously adapt to the dominant moral rules in society
and that these rules could quickly change in the context of civil wars or disasters,

famine analysis needs to recognize the legal system more as a dynamic process than a static structure.

The legal foundation of the entitlement approach creates opportunities as well as drawbacks. In modern famines, the drawbacks appear to be greater than Sen had envisaged in 1981. Devereux (2001) seems to be correct in noting that confining the analysis to legally enforceable property rights is a restrictive way of viewing famine. The legal point of departure appears to facilitate an economically based analysis while impeding a broader political analysis. The formal legal system has limited applicability in many famine-prone countries, and most contemporary famine situations seem to coexist with legal collapse. This legal anarchy during famine highlights the need not only to include informal social structures and cultural practices in the approach (that is a necessary requirement) but also to analyse legal systems endogenously to gain an understanding how they operate under stress.

The entitlement approach and the political level

Operating at the micro-level alone, the entitlement approach needs additional analytical tools to improve its capacity at the political level. Several writings explicitly or implicitly point out the need to include a political perspective in the approach to famine (De Waal 1997, Keen 1994, Crow 1992). Keen states that Sen's approach fails to account for 'the possibility that states and politically powerful groups may actively promote famine and actively obstruct relief for rational purposes of their own' (Keen 1994:5). Watts (2000:62) emphasises that entitlements are not externally given but constituted and reproduced through conflict, negotiation and struggle. Famines – as other socio-economic phenomena – always serve different interests and are therefore inherently related to struggles of power. Famines can be directly manipulated and in some cases even purposely created to obtain a given policy objective.

In Zimbabwe in 1983-1984, a famine was intentionally created in Matabeleland by means of blockades intended to strangle an uprising by the anti-government ZAPU movement (De Wail 1997:59). Alexander (1991) describes how the government's fifth brigade not only murdered thousands of civilians, but also pursued a policy of withholding food from local areas where the ZAPU movement enjoyed support. The same atrocities took place in Somalia 1991-1992, where the southern Somalis had a history of political marginalisation. This escalated to looting and confiscation during the

civil war, leading to widespread migration and famine. In the 1983-1985 Sudan famine, the Sudanese People's Liberation Army even openly acknowledged the obstruction of food as a weapon of war (Keen 1993:16). More recently in Zimbabwe, Mugabe again pursued famine-triggering policies, albeit less directly than in the beginning of the 1980s. In 2003, Mugabe encouraged veterans of the 1965-1980 war of independence to invade white-owned farms. While previously enjoying status as the breadbasket of Africa, half of Zimbabwe's population was considered food insecure by 2003 (and Zimbabwe was now known as 'the land of the empty plate'). The policies not only drove food production down, but the situation was used to serve political purposes: most of the veterans were Mugabe supporters; Mugabe distributed food to political supporters and withheld it from his political opponents; and he refused to permit international food agencies into the country to help the starving (Howard-Hassmann 2005:502).

Exploiting food as an instrument for political objectives is not just limited to a few authoritarian military states in the developing world. The CIA regarded the US food surplus in the 1970s as a very important factor of dominance, and the command over food could be used to destabilise fragile regimes (Shephard 1993:88). According to Shephard (1993), this strategy was used during the 1981-1985 Ethiopian famine. For two years, the US deliberately obstructed and delayed US food aid to the Mengistu government that was under strong communist influence at the time.

It is imperative to recognise that most famines do indeed contain strong political elements. Although famines can be triggered by economic shocks or natural disasters, modern famines are inherently political - increasingly intertwined in political agendas and power struggles. If the entitlement failure is caused by *deliberate* political action rather than *unintended* market/government failures, the approach would have limited explanatory power if not supplemented with analysis at the political level. Following the internal logic of the approach, famines are always *per definition* explained by entitlement failures, but the approach's liberal assumptions and micro-level perspective makes it an ill-suited approach within which to understand the deliberate use of famine as part of a political or military strategy. Nor does it provide any strong clues about how to analyse these political dynamics. The many different interests involved in controlling and manipulating a famine are simply not integrated into the approach. This does not make the approach redundant in famine analysis; the entitlement approach is an excellent analytical approach at the micro-level. However, if some famines are

1
2
3
4 deliberately constructed as part of a political agenda, then the approach would benefit
5 from supplementary political analysis on the macro or meso levels. The entitlement
6 approach can capture important proximate causes of famine that could be used to
7 devise effective policy responses; yet more fundamental forces of famine will often
8 reside at the macro-level, and supplementary analysis is called for to grasp the political
9 dynamics so vital in modern famines.^{iv}

16 **Conclusion**

17 Sen's basic expectation to his approach is not difficult to replicate, as he makes it quite
18 explicit: 'The entitlement approach provides a general approach for analysing famines
19 rather than one particular hypothesis about their causation' (Sen 1981:162). Elahi,
20 however, erroneously seems to assess the approach as a famine philosophy – and he
21 does so without empirical evidence to back most of his objections and without carving
22 out alternatives for famine analysis. This article found that his main objections to the
23 entitlement approach did not stand up to closer scrutiny and that the entitlement
24 approach still remains a very beneficial approach for famine analysis exemplified by the
25 2005 Niger famine. The entitlement approach merely needs adjusting to the new
26 dynamics of contemporary famines. Sen himself argued (1981:45) that his entitlement
27 approach 'makes no attempt to include all possible influences that can in principle
28 cause starvation for example illegal transfers (e.g. looting), and choice failures e.g.
29 owing to inflexible food habits.' Sen simply argued that the limitations were in most
30 cases not of a magnitude that would justify a shift away from the micro-level foundation
31 based on legal entitlements. Nevertheless, it is clear that the reliance on legal
32 structures and a benevolent government is possibly a greater limitation than Sen
33 imagined – particularly in times of civil war and conflict. Contemporary famine is
34 widespread, precisely in contexts characterised by ethnic strife, weak market
35 integration, fuzzy property rights and group-based customary law. As human-induced
36 famines have increased substantially in recent decades, so too has the need to further
37 develop and strengthen the entitlement approach with analyses on the macro and
38 meso levels.

55 **Tools to move forward**

56 So while access to food should continue to be the founding principle in famine analysis,
57 many contemporary famines would benefit from an analytical focus on the macro and
58 meso levels as well. Several practical tools that can strengthen the entitlement analysis
59
60

1
2
3
4 with increased information regarding political and institutional famine dynamics on the
5 meso and macro levels are readily available. Allow me to end this article by briefly
6 pointing out a few.
7
8

9
10
11 In order to capture the influence of informal legal structures on famine vulnerability, one
12 could turn to the *Sustainable Livelihoods Approach* that builds on the idea that
13 vulnerable people draw on a range of material and non-material assets to pursue
14 multiple strategies in the face of an external shock.^v This approach was conceived in its
15 present form in the late 1990s by DFID. Concretely, the approach often maps individual
16 or group assets according to an asset pentagon comprising the five key groups of
17 natural, physical, human, financial and social capital assets (shaped by informal legal
18 structures and cultural practices). According to this approach, people's ability to
19 strategically draw on these assets in the face of a famine will determine their survival
20 potential and long-term livelihood. Thus, although this type of approach shares the
21 micro-level foundation of the entitlement approach, the broader scope encompasses
22 informal structures and cultural practices and – as an additional advantage – it has
23 already been widely applied by development agencies and international NGOs (DFID,
24 FAO, UNDP, WFP, CARE to name a few), which warrants some institutional expertise
25 in its application. An FAO study of food insecurity in Nepal based on this type of
26 approach revealed that although certain groups officially had equal access to schools,
27 drinking water, health centers and other community facilities, in practice their access
28 was less than equal due to social exclusion based mainly on caste.

40

41
42 To obtain an overview of the more aggregate institutional and political aspects of
43 famine, simple qualitative tools such as *Stakeholder Analysis*, *Institutional Analysis* and
44 *Political Mapping* can be applied. The aim of a stakeholder analysis would be to identify
45 key stakeholder characteristics, their interests, and the nature and degree of their
46 influence on famine formation and famine prevention. Political mapping can be used to
47 illustrate (spatially) the relationship between the key stakeholders in the political
48 landscape of famine policy. The purpose could be to identify different existing fractions
49 within and between the government, the media, donor countries and international
50 NGOs with respect to famine interventions. *Institutional Analysis* can be used to
51 examine the rules that govern the identification of famine and the negotiation over the
52 implementation of policy reforms. Institutions can both be formal (legal system and
53 property rights on which the entitlement approach is mainly based) and informal
54
55
56
57
58
59
60

1
2
3
4 (cultural practices and social norms that are more peripheral to the approach). Again,
5 the institutional analysis can be conducted as a mapping exercise depicting the
6 resources and responsibilities of agencies and organisations involved with
7 implementing policies relevant for famine protection.
8
9

10
11
12 The previous description of how Zimbabwe's Mugabe exploited food for political ends
13 to reward supporters and withhold food from political opponents was easily uncovered
14 using such basic techniques. Even in the Niger famine, where the entitlement approach
15 seems to fit perfectly, there is much additional information to be gathered from the most
16 cursory interest in the political level. Niger's President Mamadou Tandja denied that
17 Niger was experiencing famine because, as he told some BBC reporters, 'the people of
18 Niger look well-fed' (BBC News August 12, 2005); he then proceeded to speak of
19 'foreign propaganda' and 'deception' by aid agencies in their attempt to raise funds and
20 maintained that the 'situation has been exaggerated for political and economic gain by
21 opposition parties and the UN agencies (quoted in The Independent 2005). Although
22 the entitlement approach could help explain the disaggregated impact of the famine, it
23 is not difficult to see how a famine could evolve under such political leadership.

51 ⁱ PRSPs describe the country's macroeconomic, structural and social policies and programs
52 over a three year or longer horizon to promote broad-based growth and reduce poverty, as well
53 as associated external financing needs and major sources of financing.

54 ⁱⁱ Many major international organizations have restrained from categorizing the Niger food crisis
55 as a famine. However, with reported mortality rates peaking around 1.7/10.000/day and an
56 excess mortality in the thousands, it seems reasonable to argue that the food crisis indeed took
57 on famine proportions.

58 ⁱⁱⁱ With some of the most apocalyptic famines in the century, the 1932-1933 Soviet famine and
59 the 1958-1961 Chinese famine, being "manmade" such a conception would be absurd.

60 ^{iv} The author wishes to thank JDS referee 1 for drawing my attention to the useful distinction
between proximate and fundamental causes of famines.

Rejoinder: 'The Entitlement Approach - A case for framework development rather than demolition'

Elahi's 2006 article subjected Amartya Sen's entitlement approach to numerous criticisms: the approach contradicted the fundamental principle of market economy; it was based on a hidden hypothesis that income distributions in non-communist states are economically and politically optimal; and it contributed to a process of landlessness and pauperization. Unfortunately, Elahi continues down the same path of unsubstantiated accusations in his response to my article, 'The Entitlement Approach – a case for framework development rather than demolition'.

Elahi quotes Sen as saying 'that people must not be allowed to become so poor that they offend or are hurtful to society. It is not so much the misery and plight of the poor but the discomfort and cost to the community which is crucial to this view of poverty. We have a problem of poverty to the extent that low income creates problems for those who are not poor.' This is a blatant misquotation, as these are actually the words of Martin Rein (1971) – not Amartya Sen. Elahi then asserts that 'Sen's moral posture about the poor' can be summed up in the following paragraph from *Poverty and Famine* (1981:9): 'To live in poverty may be sad, but to "offend or [be] hurtful to society", creating "problems for those who are not poor" is, it would appear the real tragedy.' This is a gross misrepresentation of Sen's moral position generated by conveniently leaving out to the very next line, where Sen states 'It isn't easy to push much further the reduction of human beings into "means".' Sen's standpoint is precisely that 'the focus of the concept of poverty has to be on the well-being of the poor', and that the views expressed above are 'grotesque' and should be 'dropped without further ado' (Sen 1981:9-10). Thus, Sen's stance on poverty and deprivation is the exact opposite of the questionable moral concern for the non-poor, which Elahi attempts to affix to Sen. The Nobel Prize Committee (1998) explicitly acknowledged Sen's devotion 'to the welfare of the poorest people in society',

1
2
3 and Robert Solow, another Nobel Laureate, characterized Sen as 'the
4 conscience of economics' (quoted in *India Today Magazine* 1998).
5
6
7

8
9 There is no need to speculate as to Elahi's motives for wanting to undermine
10 Sen's credibility and morality, but there is every need to condemn such a smear
11 campaign based on misquotations and misrepresentations in an academic
12 debate.
13
14

15
16
17 Admittedly, it is difficult to have a fruitful academic debate if the scholarly
18 combatants do not share the basic premises for the debate. And although Elahi's
19 clarification that by 'philosophy' he does in fact mean 'science' in general is a
20 welcome step forward, many unresolved issues still remain. Elahi believes that
21 he does not need to include any empirical evidence to substantiate his numerous
22 claims. Empirical evidence is irrelevant, for instance, when Elahi claims
23 superiority of the FAD approach over the entitlement approach; and it is
24 irrelevant when claiming that FAD is fully capable of explaining food prices in all
25 food situations. I would disagree. Furthermore, Elahi does not apparently believe
26 in contributing with suggestions as to how the research agenda should move
27 forward. Again I would beg to differ. If Sen's entitlement approach is truly useless
28 (or even counterproductive), what then is Elahi's recommended direction for
29 contemporary famine analysis? Instead of presenting the readers with a
30 Wikipedia-like reproduction of David Hume's *Treatise of Human Nature* that
31 remains strangely detached from the rest of his reply, despite Elahi's grandiose
32 claim of wanting to examine my critique 'in the light of Hume's philosophy of
33 human knowledge', I would rather have had him elaborate on these important
34 matters.
35
36
37
38
39
40
41
42
43
44
45
46
47
48

49
50
51 There is really no need to deal with Elahi's rebuttal in great depth, as I believe my
52 objections still stand strong. I have no qualms leaving it to the reader to decide
53 whose observations and objections are 'logically weak' and 'deficient from an
54
55
56
57
58
59
60

1
2
3 economic perspective'. Allow me, however, to end with the following brief
4 remarks:
5
6

7
8
9 Ad 1) Elahi incorrectly claims that Sen ignores the fact that speculative – not
10 actual demand – determines food prices, *not* because Sen is a Nobel Laureate in
11 Economics, but because Sen *is* indeed attentive to speculative demand; a point
12 for which I have provided concrete evidence.
13
14

15
16
17 Ad 2) Although I am pleased to see that the entitlement approach now merely
18 changes the nature of a market economy instead of being inconsistent with the
19 principles of capitalism, as per Elahi's original claim, I still lack a valid reason for
20 why the entitlement approach – or rather, policies based on the approach –
21 would fundamentally change the nature of a market economy when the myriad of
22 far more wide-ranging policies do not.
23
24
25
26
27

28
29
30 Ad 3) The entitlement approach is not inherently long- or short-term. The
31 collapse of endowments (due to drought or illness) is often short-term, and there
32 is nothing methodologically preventing this from being analyzed in the entitlement
33 approach. Moreover, the fact that an analytical framework has been developed to
34 analyze famine and food security issues can never logically in any way 'disqualify
35 the poor from entitlement of many life-saving services' such as education and
36 healthcare.
37
38
39
40
41
42

43
44 Ad 4) As Elahi appears capable of uncovering hidden hypotheses in Sen's
45 writings that have eluded both Sen himself as well as all other scholars for 25
46 years, it is indeed a waste of academic resources not to have Elahi more
47 engaged in empirically based research and in moving the famine research
48 agenda forward. In the absence of Elahi's endeavors in this regard, one must
49 settle for my article above specifying the implications of contemporary famine
50 characteristics; or – for a more comprehensive study – one could turn to *The*
51 *New Famines*, edited by Stephen Devereux (2007), which forcefully articulates
52
53
54
55
56
57
58
59
60

1
2
3 the need for a change in the thinking about famine, i.e. viewing famines as
4 political outcomes rather than failures of food availability or access to food.
