Introduction

In the last five years, informal science institutions (ISIs), science communication, advocacy and citizen action groups, funding organizations, and policymakers in the United Kingdom and United States¹, have become increasingly involved in efforts to promote increased public engagement with science and technology. Such engagement is described as taking place within the context of a ‘new mood for dialogue’ between scientific and technical experts and public(s) (e.g. House of Lords Select Committee on Science and Technology, 2000; United States Congress, 2003). Mechanisms to increase public engagement with science and technology have taken a number of forms. One of the most visible features of this shift towards public engagement with science and technology (PEST) in informal science institutions is the organization and staging of adult-focused, face-to-face forums that bring scientific and technical experts and policymakers into discussion with members of the public about contemporary scientific and socio-scientific issues related to the development and application of science and technology (Dana Centre/Science Museum, 2003; British Association for the Advancement of Science, 2005; National Science Foundation, 2005; Gammon & Burch, 2006; Museum of Science, Boston, 2006).

A significant aspect of the literature on efforts to increase public engagement with science and technology has focused on the development of a unifying evaluative framework for determining what counts as success for PEST mechanisms, and how success (or lack thereof) can be empirically measured. However, the increase in the funding and number of these ISI-based ‘dialogue events’ (as commonly denoted by science education and communication practitioners) has received relatively little attention within the published literature on PEST. The role and value of ISI-based ‘dialogue events’ – for event organizers, public participants, invited experts, or funding agencies – has not been theorised or examined. We also do not yet know what effect ‘dialogue events’ have had, more broadly, in creating a culture of increased engagement. Finally, there is a need for discussion and critical thought with respect to what counts as success for these ‘dialogue events’ – and for whom?

In this article, we draw from our experiences as UK and US-based ‘dialogue event’ practitioners and researchers/evaluators to suggest that existing evaluative criteria for efforts to increase public engagement with science and technology are insufficient to explore the role and value of ISI-based ‘dialogue events’. Instead, we suggest that it may be productive to research and evaluate these ISI-based ‘dialogue events’ as sites of learning. Secondly, however, we show through a discussion of our own research frameworks that understanding these ‘dialogue events’ as sites of learning does not intuitively provide a framework for understanding what counts as success for these efforts. Instead, research on the role of ‘dialogue’ within the educational literature – and the connections between ‘dialogue’ and competing understandings of the nature of science and society – offers a multiplicity of approaches to defining the terms and goals of these events. Finally, we identify two broader implications of researching and evaluating these ‘dialogue events’ as sites of learning for ISIs and all efforts to increase public engagement with science and technology.

¹ For the purposes of this article, we limit our discussion to the United Kingdom and United States. However, we should note that efforts to increase public engagement with science and technology are not limited to Anglo-American contexts.
A Brief Overview of ISI-Based ‘Dialogue Events’

This brief overview of ‘dialogue events’ is provided to highlight the diversity of contexts, stakeholders, and funding mechanisms that shape the practice of ‘dialogue events’ today. At the same time, however, this overview shows that ‘dialogue events’ can be robustly defined across this diversity of contexts as adult-focused, face-to-face forums that bring scientific and technical experts, social scientists, and policymakers into discussions with members of the public about contemporary scientific and socio-scientific issues related to the development and application of science and technology – and that these ‘dialogue events’ are an emergent feature of informal science institutions in our countries of study, the United Kingdom and United States.

In the past five years, adult-focused ‘dialogue events’ have become a visible and well-attended facet of informal science institutions in the United Kingdom. As highly trusted cultural institutions (OST & Wellcome Trust, 2000; National Science Board, 2004) with extensive audience reach and expertise in science communication and education, ISIs increasingly understand themselves as ‘hubs for dialogue and debate between scientists and the public’ with the ability to ‘respond rapidly to new developments and science by hosting and supporting debates rather than only by creating new exhibitions’ (BA, 2005, p. 70; see also: Thelan, 2001; Hirzy, 2002). This shift towards dialogue within ISIs has occurred within the context of the broader cultural shift towards public engagement with science and technology, as well as in response to visitor requests for socioscientific topics to be addressed in an engaging and accessible manner for a non-specialised audience (Simonsson, 2005; Simonsson, 2006a; Simonsson, 2006b). Finally, ISIs have been attracted to ‘dialogue events’ and other efforts to increase public engagement with science and technology as an opportunity to expand and diversify their visitor demographics – that is, to move beyond their primary audience of family visitors to include adults who do not otherwise visit the institutions (Simonsson, 2005; Simonsson, 2006a; Simonsson, 2006b).

For instance, the Dana Centre, which opened in 2000, is a purpose-built venue at the Science Museum (London) designed to provide adults with ‘a place for them to take part in exciting, informative and innovative debates about contemporary science, technology, and culture’ (Dana Centre / Science Museum, 2003). It includes a café/bar where participants can interact both before and after events, which are held 2-4 times per week. Approximately 30% of the events held at the Dana Centre are classified as ‘dialogue events’ that ‘aim to generate open-ended discussion between the general public, scientists, policy-makers and campaigners’; ‘build trust, understanding, an empathy between the public, scientists, and policymakers’; and ‘provide an opportunity for thoughtful and informed debate where participants can express and share opinions and suggestions’ (Gammon & Burch, 2006, p. 3).2 Iterative processes of model building and evaluation have been integral to the development of dialogue-based, contemporary science programming at the Dana Centre since its inception. For a discussion

2 Roughly 60% of the Dana Centre events focus on increasing awareness and interest in contemporary science through techniques such as forum theatre, interactive panelist debates, handling sessions using real objects from the museum’s collection, art installations, and science comedy events. The other 10% of events include deliberative discussions directly connected to science and technology policy-making processes (such as the current Meeting of the Minds – European Citizen’s Deliberation on brain science).
of this ongoing process, see McCallie, et al (forthcoming). The Darwin Centre at the Natural History Museum (London) and Explore-at-Bristol, amongst other UK ISIs, also organize regular ‘dialogue events’ aimed at adults. Non-ISI organizations in the UK also regularly facilitate ‘dialogue events’. For instance, the Café Scientifique network in the UK now includes over 30 different sites that seek to provide a ‘forum for debating science issues’, all ‘for the price of a cup of coffee or a glass of wine’ to ‘promote public engagement with science and to make[e] science accountable’ (Café Scientifique, 2006). First held in Leeds in 1998, these events occur at cafés, bars, restaurants, and theatres. Sponsors for ‘dialogue events’ inside and outside ISIs in the UK include the Wellcome Trust, the British Council, the British Association for the Advancement of Science, and the Royal Society under the broad heading of supporting public engagement with science and technology.

Overall, ISIs in the US have not been as involved in staging ‘dialogue events’ as their UK counterparts. However, this is changing. For instance, the Museum of Science, Boston, is currently offering an experimental program called ‘Forum’ that seeks to provide an opportunity for people with a variety of perspectives – experts and non-experts alike – to explore each other’s views and share information about ‘the impact of science and technology on the individual, society, and the environment’ (Museum of Science, Boston, 2006; see also: Boyde, 1999; Davis, 2004). The new NSF-funded ‘Nanoscale Informal Science Education Network’ (NISE) (awarded October 2005), led by the Exploratorium (San Francisco), the Museum of Science, Boston, and the Science Museum of Minnesota, provides funding for public forums ‘that will allow for open discussion and debate about issues related to nanotechnology’ (NSF, 2005).

However, as is the case with NISE, much of the past funding for ‘dialogue events’ in the US appears to have been provided on an issue-by-issue basis, rather than to support public engagement with science and technology more broadly. For instance, funding for the US Human Genome Project (1990-2003; coordinated by the U.S. Department of Energy and the National Institutes of Health) required that 3-5% of the total funding of the project was set aside to address the ethical, legal, and social implications (ELSI) of new genetic technologies. While much of the ELSI funding supported the development of programs and products directed at policymakers, journalists, lawyers, medical practitioners, and K-12 and post-secondary teachers, a portion of this money was directed at the ‘public understanding’ of the human genome project and its ethical, legal, and social implications. While most of these funded projects generated products to be distributed to the public (e.g., pamphlets, newsletters, TV and radio programs, websites), this money was also used to fund ‘dialogue events’ that occurred both inside and outside ISI settings. Finally, in the US, ‘dialogue events’...
events’ have also been funded by Humanities Councils. For instance, the Choices and Challenges Project at Virginia Tech has organized a series of ‘dialogue events’ over the past 20 years that have been partially funded by the National Endowment for Humanities and the Virginia Foundation for Humanities.

Reconceptualising Efforts to Increase Public Engagement with Science and Technology: ISI-Based ‘Dialogue Events’ as Sites of Learning

A significant aspect of the literature on efforts to increase public engagement with science and technology has focused on the development of a unifying evaluative framework for determining what counts as success for PEST mechanisms, and how success (or lack thereof) can be empirically measured. In this section we suggest that while ISI-based ‘dialogue events’ are understood by event organizers, public participants, invited experts, and funding agencies as an effort to support increased public engagement with science and technology, the existing PEST evaluative criteria are insufficient to explore the role and value of ISI-based ‘dialogue events’. Instead, we suggest that it may be productive to research and evaluate these ISI-based ‘dialogue events’ as sites of learning.

Based on an extensive review of research and evaluation literature on efforts to increase public engagement with science and technology, Rowe and Frewer (2000; revised Rowe, et al, 2004, p. 93) have identified the evaluation criteria found in Table 1. While PEST researchers have identified the need to measure multiple outcomes, the literature has consistently emphasized that visible and measurable ‘impact on policy’ is a primary criteria of success for these efforts (Wilsdon & Willis, 2004; Rowe et al, 2005; Parliamentary Office of Science and Technology, 2006). From this perspective, public engagement efforts that do not facilitate direct public impact on policy, such as GM Nation, are failed efforts (Rowe et al, 2005). Other agreed upon criteria include the representativeness of participants; the early involvement of participants in the organization of the public engagement with science and technology project; and transparency (Rowe, et al, 2004, p. 93).

Table 1: The (Revised) Evaluation Criteria of Rowe and Frewer (2000)

Source: Rowe, et al, 2004, p. 93

As ISI-based ‘dialogue events’ likewise aim to increase public engagement with science and technology, it initially appears reasonable to employ existing PEST evaluative criteria to determine the success of these events. However, given the emphasis on ‘impact on policy’ within the existing PEST literature, applying these criteria to ISI-based ‘dialogue events’ would immediately position these events as failures. The majority of ISI-based ‘dialogue events’ have no formal connection to policy-making processes. Existing efforts to develop a unifying framework for researching and evaluating public engagement with science and technology efforts thus fail to allow for the possibility that these ISI-based ‘dialogue events’ have value.

Is there any value in ‘dialogue events’ that do not seek to facilitate direct public impact on policymaking? We wish to suggest that simply applying the existing criteria developed to determine the success of more formal PEST mechanisms to these ‘dialogue events’ is a mistake that hinders our understanding of the possible role and value of these efforts. Thus we argue that in order to facilitate research into these ISI-based ‘dialogue events’ and their possible value, it is necessary to demarcate between two classes of PEST mechanisms (and two sets of evaluative criteria): 1) mechanisms that seek to facilitate direct public participation in scientific and technical decision-making; and 2) mechanisms that seek to promote a broader culture of engagement in the interactions between scientific/technical experts, policymakers, and public(s) but do not seek to facilitate direct public participation in policy-making.

Demarcating two classes of public engagement with science and technology mechanisms makes ISI-based ‘dialogue events’ (and related efforts) visible to PEST researchers and evaluators by recognizing that these events may have value even though they do not seek to facilitate direct public participation in scientific and technical decision-making. However, it begs the question: how should we research and evaluate the second class of mechanisms to understand their possible value? In our own work, we have found it productive to research and evaluate these ISI-based ‘dialogue events’ as sites of learning.

We recognize that conceptualising ‘dialogue events’ and other public engagement efforts as sites of learning may seem dangerous in the context of the failure of the ‘deficit model’ associated with efforts to increase the public understanding of science in the 1980s and 1990s. This model began with ‘an apparent assumption of ‘public ignorance’ in matters of science and technology’ (Irwin & Wynne, 1996, p. 6). Public controversies over science and technology were thus understood to be ‘created by inadequate public understandings rather
The Value of ‘Dialogue Events’ as Sites of Learning

than the operation of science itself’ (Irwin & Wynne, 1996, p. 6). As Irwin and Wynne suggest, the deficit or ‘public ignorance’ model of public understanding of science ‘creates boundaries between the public and science and scientific institutions, and focuses the attention of analysts, policymakers, the news media, science educators, and so on, only on the problematic/problematised public – begging the question, ‘just why aren’t the public more responsive?’ (Irwin & Wynne, 1996, p. 6). Two additional assumptions were present in the deficit model: 1) science was assumed to be ‘an important force for human improvement,… offering a uniquely privileged view of the everyday world,’ and 2) science was always described and imagined as a value-free and neutral activity (Irwin & Wynne, 1996, p. 6).

Within the context of the public understanding of science movement, the solution to public ignorance was to increase scientific literacy through science education. Today, in the UK, the deficit model has – in theory, at least – been firmly rejected in response to a series of crises in the public trust of science and the government in the 1990s (e.g. the BSE and GM foods controversies), and a ‘new mood for dialogue’ between scientists, policymakers, and various publics has emerged as its replacement (House of Lords, 2000). Dialogue has thus replaced education as the goal with the shift from public understanding of science to public engagement with science and technology. Is it therefore wise to reintroduce the idea of learning into efforts to increase public engagement with science and technology?

To date, as we have seen, the criteria established to evaluate the success of public engagement efforts have not focused on learning. When learning is discussed, it is consistently positioned as a low-level goal of participatory mechanisms. For instance, Involve (2005), a public participation think-tank, ranks ‘inform’ as the lowest level of public impact. Most efforts to evaluate the success of public engagement with science and technology mechanisms, as shown above, do not even include education or learning as a measurable outcome. However, in rejecting the model of education located in PUS, is it necessary or appropriate to reject the possibility of learning altogether?

We believe not. In the following section of this paper, we describe the ways in which we, as UK and US-based ‘dialogue event’ practitioners and researchers/evaluators, are currently integrating research on the educational value of ‘dialogue’, ‘talk’, and ‘discourse’ with existing evaluation criteria for efforts to increase public engagement with science and technology. Our work aims to explore the role, value, and practice of PEST mechanisms which seek to promote a broader culture of engagement in the interactions between scientific/technical experts, policymakers, and public(s), but do not seek to facilitate direct public participation in policy-making – such as ISI-based ‘dialogue events’. However, what this discussion of our own research frameworks should make clear is that understanding these ‘dialogue events’ as sites of learning does not intuitively provide a framework for understanding what counts as success for these efforts. In fact, much is at stake in the choices we make as researchers and evaluators regarding what counts as learning in these contexts. These choices shape the ways in which we define the terms and goals of these events – and the ways in which we, as researchers and practitioners, envision what counts as an ideal

relationship between scientific and technical experts, policymakers, and public(s).

Three Frameworks: Researching & Evaluating ‘Dialogue Events’ as Sites of Learning

In this section, we describe three related but distinct approaches to researching and evaluating ‘dialogue events’ as sites of learning in order to show how perspectives from education can provide tools and frameworks to understand what counts as successful dialogue about socioscientific issues in contexts when dialogue is not directly linked to policy-making. However, we also make visible the ways in which existing debates within educational research about the purposes of ‘dialogue’ encourage us to interrogate and challenge the framing assumptions of ISI-based ‘dialogue events’ that do not seek to directly inform policy.

Framework 1: Collaboration and Equity

McCallie (2006a, 2006b) has drawn from her work with ISIs and from literature on the learning sciences, science education, and museum learning to develop a framework for researching and evaluating ISI-based ‘dialogue events’. McCallie has identified four goals in ‘dialogue event’ mission statements and in her interviews with ISI-based ‘dialogue event’ practitioners, which underpin her research framework. These include: (1) the promotion of collaborative talk; (2) the enhancement of equitable interactions; (3) the development of new or different understandings or knowledge; and (4) the enhancement of interest and engagement in controversial science-based issues in society (socioscientific issues). McCallie’s current research primarily focuses on the first two goals, which can be understood as process goals.

McCallie defines collaborative talk as any collective verbal interaction in which participants listen, respond/refute, and build on one another’s contributions in the process of exploring an idea or topic. For McCallie, equity in dialogue events includes both valuing a diversity of perspectives and contributions in terms of what is considered in the discussion, as well as valuing the diversity of people present in terms of their membership and participation as part of a community. Thus, McCallie focuses on collaboration and equity as markers of quality and success for ISI-based ‘dialogue events’. Her understanding of collaborative talk and equity in her research is shaped by her exploration of research on classroom dialogue, sociocultural and interactional approaches to understanding learning, and socioscientific controversies.

Researchers and practitioners within the learning sciences, science education, and museum learning have increasingly highlighted the need for ‘dialogue’, ‘talk’, and ‘discourse’ as a necessary component of learning as well as a process of learning (e.g., Lipman, 1991; Bransford, Brown, & Cocking, 1999; Mercer, 2000; Allen, 2002; Ash, 2004; Rowe, 2004; Alexander, 2005; Andriessen, 2006; Sawyer, 2006). The central idea in much of this research is that one articulates, builds, and solidifies one’s understandings through processes of expressing oneself and actively engaging with others. Researchers have identified various patterns of such verbal interaction, which, as a group of patterns, Sawyer (2006) refers to as collaborative discourse. McCallie analyses ‘dialogue event’ interactions for various types of talk, including collaborative discourse such as exploratory talk and argumentation.
Exploratory talk is a term used to indicate collaborative discourse that is in process, specifically talk about ideas that are not in final form (Barnes, 1975; Cazden, 2001). Mercer (1996) describes it as “occurring when partners engage critically but constructively with each other’s ideas” (p. 369). As dialogue events are to facilitate growth through the exchange and interaction of views and experiences, McCallie examines dialogue events for exploratory talk.

Another type of collaborative discourse that is argued to support both learning and thinking is that of argumentation (Driver, Newton & Osborne, 2000; Duschl & Osborne, 2002; von Aufschnaiter, Erduran, Osborne, & Simon, in press). Following from the analyses of structural patterns of argumentation, Toulmin (1958) suggests that argumentation has consistent types of micro-structures across fields. He describes three fundamental components: data, claims, and warrants, as well as several other components. Claims are the assertions or conclusions, whether tentative or forceful, which are supported by data. Data is the evidence, the foundation on which the claim is based. Warrants are the general principles of the field that bridge data with claims, illustrating that the connection between the data and claims is an ‘appropriate and legitimate one’ (Toulmin, 1958, p. 98). McCallie shares Duschl and Osborne’s (2002) conclusion that Toulmin’s model is a valuable contribution to understanding interaction. For example, Duschl and Osborne (2002) argue that the model recognizes argumentation as a highly social and contextualized process that allows for a view of the nature of science that moves beyond science as a ‘rhetoric of conclusions’ (Schwab, 1962) or ‘final form’ science (Duschl, 1990), in which science is presented a clean, neat and undisputed series of discoveries. Further, Toulmin’s emphasis on the importance of context in determining what counts as appropriate and acceptable data, claims, and warrants suggests that values and belief systems can be legitimate aspects of argumentation as ISI-based ‘dialogue events’. For McCallie (2006a, 2006b), this understanding of the nature of argumentation explicitly creates opportunities for public(s) – despite a lack of formally recognized scientific or technical expertise – to legitimately and equitably participate in ‘dialogue events’ on controversial socioscientific issues, and provides tools to ‘trace[e] the quantity and quality of argumentation’ (Erduran, Simon & Osborne, 2004, p. 916; see also: Simon, Eduran & Osborne, 2006).

Notably, from our and McCallie’s perspective, this research on ‘dialogue’ in education rejects the teacher-centered deficit or transmission-and-acquisition model (Sawyer, 2006) of education. Instead, it takes a socio-cultural approach to understanding learning in which teachers and students are understood as a community of learners, ‘working together with all serving as resources to the others, with varying roles according to their understanding of the activity at hand and differing (and shifting) responsibilities in the system’ through multidirectional dialogue (Rogoff, Matusov & White, 1996, p. 397). In this context, understanding ‘dialogue events’ as sites of learning forces analytical attention to the interaction (Greeno, 2006) among the public(s) and invited scientific, technical, social science, and policy experts. In fact, this perspective also allows the researcher to explore whether public participants should be understood as experts, in a reciprocal fashion, such as on the social dimensions of emerging sciences and technologies during the ‘dialogue event’ (following Sclove, 1995).

Finally, McCallie’s research framework draws from research in science education focused on socioscientific controversies (Millar & Osborne, 1998; Patronis, Potari & Spiliotopoulou,
example, Sadler (2004) argues that research focusing on socioscientific issues addresses four themes: (a) socioscientific argumentation, (b) relationships between nature of science (NOS) conceptualizations and socioscientific decision making, (c) the evaluation of information pertaining to socioscientific issues, and (d) the influence of conceptual understanding on informal reasoning’ (Sadler, 2004, p. 515). As Sadler’s (2004) typology suggests, much of this research has focused on analyzing patterns of argumentation and student interaction in the context of socioscientific controversies. For instance, Jiménez-Aleixandre and Pereiro-Munoz (2002) analyzed student decision-making processes related to environmental management, and concluded that students combined conceptual knowledge, scientific evidence, and value judgments in their decision-making practices. For McCallie, these types of analyses provide ways of exploring the intersections of scientific evidence and social values apparent in discussions about socioscientific controversies at ‘dialogue events’.

**Framework 2: Symmetrical Individual Learning Through Social Processes**

Drawing from a similar literature to McCallie (2006a, 2006b), supplemented by research in science communication and critical public understanding of science (see Laird 1993; Limoges 1993; Rip 1986), Davies, et al, (in press) suggest that non-policy informing ‘dialogue events’ can be productively understood as sites of symmetrical individual learning through social processes. Thus, in contrast to the existing focus in PEST research and evaluation literature on ‘impact on policy’, research and evaluation efforts should focus on change at the individual rather than institutional level for these events. Notably, these researchers examine how ISI-based ‘dialogue events’ facilitate individual change – or learning – for all those involved in the dialogue process, whether scientists, policymakers, and public(s), and define learning as more than an accumulation of facts. Drawing on both current educational literature and the literature of public participation (Cremin 1988; Lave and Wenger 1999; Limoges 1993; Rip 1986; Rogoff et al 2003), for these authors learning involves emotions, empathy, and social understandings, and is an active and participatory process focused on growth in mutual understanding, awareness, and knowledge of competing perspectives on socioscientific issues as well as ‘facts’. ‘Dialogue events’ are thus positioned as providing opportunities for empowering individuals for further involvement, as personally beneficial for all participants (whether technical experts or laypeople), and as part of a gradual step-by-step change in science and society. The emphasis on symmetry in learning avoids a deficit model perspective of PEST as ‘educating’ the public, and their conceptualisation of ‘learning’ moves the focus from the transmission of ‘facts’ to the build up of social understandings.

For Davies, et al (in press), ‘dialogue events’ are thus explicitly understood as sites of education for scientifically literate citizenship, in which scientific and technical experts, policymakers, and public(s) are understood as citizens both challenged by and contributing to decision-making about complex socioscientific controversies. The potential strength of ISI-based ‘dialogue events’ is the opportunity to create interactions between ‘those who generate scientific knowledge, those who affect its use in context, and those who experience it in daily life’ to ‘bring to the fore the social, cultural, and moral aspects of science in society in order for them to be discussed transparently. In this way, dialogue events move beyond serving as a forum for transmission and acceptance of science to a place of problematizing and
negotiating knowledge’ (Davies et al, in press). ‘Dialogue events’ are thus envisioned as part of the practice of more effective citizenship and the establishment of new relationships between science and society. They are seen as sites for change, but of change on a small-scale, which may, however, escalate into larger shifts within science and society.

Such a vision of ISI-based dialogue creates a framework for further analysis and evaluation. Contrary to previous typologies and evaluative strategies (RCUK 2005; Rowe and Frewer 2000; 2004; 2005), which tend to focus on large scale impacts, this theorisation of non-policy related dialogue will lead to a focus on individual or small group interactions, experiences, and impacts. The emphasis will be on understanding how these interactions function and on evaluating whether the strict conditions of symmetry and equity are met. In fact, the entire criteria for ‘success’ will have shifted: events which look like ‘failures’ according to other criteria – little resolution or identifiable outcomes, a cacophony of different voices, little transfer of scientific ‘facts’ – may, according to this schema, be viewed as successes (cf. Seifert 2006).

Lehr and Caron (2006) focus extensively on the ways in which researching and evaluating ‘dialogue events’ as sites of learning creates an opportunity to critically examine the calls for and practices of dialogue within ISI-based public engagement efforts and to make visible underlying assumptions of event organizers, funders, and expert and public participants – paralleling critical analyses of the broader cultural shift towards public engagement (e.g., Irwin, 2001; Wynne, 2005). For instance, practitioners identify building ‘trust, understanding, and empathy between the public, scientists, and policy-makers’ (Gammon & Burch, 2006, p. 3) as an objective of ‘dialogue events’ that do not seek to enable direction public participation in scientific and technical decision-making. The development of increased public interest in science and technology and public confidence in discussing science and technology are understood as interrelated goals. These practitioner objectives appear to parallel those of many researchers and practitioners within science education who understand the goal of science education for non-scientists to be the development of individuals who ‘will act as informed, responsible citizens’ (Zembylas, 2005, p. 711), who are ‘capable of applying scientific knowledge and habits of mind’ (Sadler, 2004, p. 514) in the context of socioscientific controversies.

However, within science education research, questions have been raised about whether increasing trust and confidence in science should be goal of science education for non-scientists. Lehr (2006) notes that there is nothing inherently wrong with the idea that science educators seek to train future citizens, not just future scientists. Indeed, within a world where non-scientist citizens are increasingly required to make private and public decisions about science and technology, this shift to include the needs of these future citizens within formal and informal science curricula/programs can be understood as ‘radical’ (Osborne, 2004) – and ISI-based ‘dialogue events’ are part of this trend. However, the problem for Lehr (2006) emerges in the model of scientifically literate citizenship located within these efforts to train ‘informed, responsible citizens’. Critics within science education suggest that it is necessary to examine the power relations and inequities embedded in existing scientific knowledge and habits of mind, and to offer, as an alternative, ‘science teaching and learning practices that empower children, builds solidarity, and initiate change’ (Zembylas, 2005, p. 710).
These efforts, which Zembylas describes as ‘teaching science for social justice’ in contrast to ‘science education for citizenship’, focus on creating more critical relationships between science and society, focusing on changing science, not public(s). Roth and Barton (2004) have recently argued that the model of scientific literacy dominant within science education needs to be reconceptualized, suggesting that science should be understood not as ‘a single normative framework for rationality but merely one of many resources that people can draw on in everyday collective decision-making processes’ (Roth & Barton, 2004, p. 158) as they engage in the struggle to create a more just and equitable world.

Following from these debates within science education, Lehr and Caron (2006) ask whether the goal of ISI-based ‘dialogue events’ should be to increase trust between scientific and technical experts, policymakers, and public(s) or to create more critical and oppositional perspectives? In other words, is a ‘bad’ attitude towards science necessarily a ‘bad thing’? Rather than understanding the events as opportunities to increase trust between scientific and technical experts, policymakers, and public(s), Lehr and Caron (2006) explore how ‘dialogue events’ can serve as opportunities to create more oppositional practices of non-scientist citizenship, providing non-scientist citizens with tools to question and even challenge the authority of scientific knowledge in personal and public scientific and technical decision-making practices. Research questions ask how participants understand the ‘dialogue event’ series as a resource in decision-making practices and seek to identify the other scientific and non-scientific resources that participants utilize to respond to socioscientific controversies and uncertainties.

Lehr and Caron (2006) also draw from educational theory outside of science education to raise questions about the possibilities of equitable dialogue amongst scientific and technical experts, policymakers, and public(s). For instance, whereas idealized models of dialogic and critical (Freire, 1972) pedagogy emphasize the educational need for inclusivity and equality amongst dialogue participants, critics have challenged the idea that it is even possible for actors to be situated equally within the rational public sphere that is assumed by dialogic pedagogy proponents (Ellsworth, 1989). Lehr and Caron (2006) are thus exploring whether existing power differences between scientific and technical experts, policymakers, and public(s) can be disrupted at ‘dialogue events’. Other critiques of dialogic pedagogy (Boler, 1999; hooks, 1994) have emphasized the need for emotion as a valued component of dialogue – whereas emotion is typically written out of calls within formal education to support dialogue, debate, and argumentation around socioscientific issues. Lehr and Caron (2006) are exploring how emotion is or is not supported at ‘dialogue events’, as well as how conceptions of ‘rational’ vs. ‘irrational’ function as part of their efforts to understanding how ‘dialogue events’ function for social justice.

**Implications: Relationships Between Science and Society in Models of Learning**

In the previous section, we have begun to explore the usefulness of researching and evaluating ‘dialogue events’ as sites of learning by showing how we are currently employing perspectives from education to identify the value of ‘dialogue events’ that do not seek to facilitate direct public participation in policy-making. The work we have described is currently in-progress. We recognize that what we have offered are three related but distinct frameworks for researching and evaluating ‘dialogue events’ rather than empirical findings. However, we have discussed this work-in-progress for multiple purposes. First, we wished to
show the potential fruitfulness of understanding ‘dialogue events’ as sites of learning in the development of research frameworks and evaluative criteria to assess PEST mechanisms that do not seek to facilitate direct public participation in policy-making. Second, however, we sought to trouble the idea that understanding these ‘dialogue events’ as sites of learning intuitively provides a framework for understanding what counts as success for these efforts. Instead, as we have shown, adopting different perspectives from educational literatures creates different models of success.

The models of learning and the associated visions of the ‘ideal’ outcomes for ISI-based ‘dialogue events’ that are embedded in the three research frameworks discussed above share many similarities. These include an understanding of all participants in ISI-based ‘dialogue events’ as both (potential) learners and contributing experts, and an understanding of ‘dialogue events’ as a site for renegotiating the relationship between science and society. Where our frameworks differ is in the ways in which we envision the outcomes of this renegotiation. However, that is fitting, as it is the dialogue participants, themselves, who have the potential to collaboratively determine the regulations of the new, emerging relationships between scientific and technical experts, policymakers, and public(s). It is our responsibility as scholars/practitioners researching and evaluating ISI-based ‘dialogue events’ as sites of learning to make explicit how our own commitments regarding the ideal relationship between science and society shape the questions we ask and the educational theories we employ.

Implications for Informal Science Institutions

We wish to note one final intersection in the three research frameworks discussed above. Each approach points to the possibility of reshaping our understanding of the role of informal science institutions in society. McManus (1992) identifies three generations of ISIs. Here, we suggest that a ‘fourth generation’ of ISIs may be emerging. According to McManus (1992), the first generation of ISIs were object-based and were typically private or elite collections of objects and specimens from the natural world, as well as artefacts, such as early scientific instruments. Many of these collections were originally created as ‘cabinets of curiosity’ (Janousek, 2000; McManus, 1992; Melber & Abraham, 2002; Orosz, 1990). As an Enlightenment project, this generation of ISIs emphasized the collection and classification of the natural world for the purpose of research and the production of natural knowledge (Allmon, 1994; Hooper-Greenhill, 1991). In the eighteenth and nineteenth centuries, many of these exhibitions were ‘opened’ to the public. This resulted in the positioning of ISIs as ‘experts in mediation between the esoteric world of science and that of the public’ (Farmelo & Carding, 1997). However, the understanding of ISIs as curated collections of objects remained in this transition to an educational mission.

The second generation of ISIs shifted from objects in the natural world to objects created by advances in science and industry (McManus, 1992). While still object-based, the new narrative of this generation of ISIs emphasized the industrial progress of human society as a strategy to affirm and increase public acceptance and support for science and technology, particularly in the post-World War II and Cold War contexts (Bradburne, 1998, p. 239). This new emphasis paralleled efforts in formal science education to train future non-scientist citizens to appreciate and support science and scientists during the same time period (Rudolph, 2002). Collection, conservation, and research remained important aspects of this generation, in addition to public education.
The third generation of ISIs emerged in the 1960s and 1970s with the advent of science centres. For McManus (1992), third generation ISIs represented a move from objects-based exhibits to scientific concept or phenomena-based exhibits. A pedagogical shift also occurred from a transmission or didactic model of education to a constructivist model that ‘regard[ed] the learner as an active participant in the construction of new knowledge and understanding’ (Johnson, 2005). Ansel (2003) describes three factors that distinguish science centres from previous museums: ‘1) They show real phenomena and allow for real experiences, 2) they do so in an enjoyable, unstructured, highly social setting and 3) they provide teaching props, models and programs which visitors are unlikely to encounter elsewhere’ (Ansel, 2003, p. 3).

The third generation of ISIs challenged many of the assumptions about the role and value of ISIs found in the two earlier generations, and now many ISIs that can be classified as first or second generation have incorporated elements of the science centre approach. However, while a shift did occur in the pedagogical model employed – from training geared towards ‘knowing lots of science’ to ‘thinking like a scientist’ – the authority of scientific knowledge remains unchallenged even within the third generation of ISIs.

What is the future of ISIs? Shifts have already occurred to complicate McManus’ three-generation categorization. For instance, Pedretti (2004) has identified a new category of exhibits at science centres that ‘critically explore the nature of science and the relationship among science, technology, society, and environment’. Critical issues-based exhibits ‘invit[e] visitors to consider such scientific material from a variety of perspectives, engage in decision-making and healthy debate of complex issues, and critique the nature and practice of science and technology’ (Pedretti, 2004, p. S36). Rennie and Stocklmayer (2003) suggested that a shift by ISIs to include “science and technology’s engagement with the public” may represent the way forward” (Rennie & Stocklmayer, 2003, p. 768) in the future development of ISIs. However, they also noted that, ‘It is very difficult at this time to make predictions about how this can happen’.

We suggest here that understanding ‘dialogue events’ as sites of learning may provide us with a way to understand how ISIs can become more involved, through their programming and exhibits, in increasing public engagement with science and technology. However, this shift necessitates more than simply the addition of socioscientific controversies to the existing content of ISIs (whether object or concept-based). Instead, if the efforts of ISIs to support increased public engagement that is not linked to policy-making are to have value, then they must involve the incorporation of new understandings of learning, focused on symmetry and mutuality. The possibility exists for ISIs to operate not as (only) storehouses of knowledge, but as sites for the production of new knowledge through dialogic engagement between scientists, policymakers, and public(s). ISIs have the opportunity to function as a resource for the production of this new knowledge by bringing together and training scientists, policymakers, and publics in how to interact dialogically, contributing their own expertise on science, technology, and education to the discussions, and creating the possibility of a space within the broader culture for public dialogue to take root.

**Implications for Efforts to Increase Public Engagement with Science & Technology**

There is a second important implication of researching and evaluating ‘dialogue events’ as sites of learning. Efforts to identify the educational value of public engagement with science
and technology mechanisms that do not seek to facilitate direct public participation in policy-making also raise the question of whether learning should function as an evaluative criterion for those efforts that do seek to facilitate direct public impact.

As we hope to have shown in the body of the paper, learning can be understood as more than a simplistic transmission-and-acquisition model of teaching and learning. Examining the effect of ‘dialogue events’ in creating an opportunity for symmetrical or mutual learning on the part of scientists, policymakers, and public(s) is a useful mode of research and evaluation for non-policy informing efforts. What of the public engagement with science and technology mechanisms that do seek to facilitate direct public participation in scientific and technical decision-making, however? In conclusion, we wish to make one final suggestion: more is at stake in public engagement with science and technology mechanisms that seek to facilitate direct public participation in policy-making than a particular policy or decision. What is at stake, as well, is the possibility of a broader culture of engagement in the interactions between scientific/technical experts, policymakers, and public(s). Understanding all public engagement with science and technology efforts as potential sites of learning may be a productive way to explore ways to support the broader cultural transformation we wish to see.

Notes on Contributors
This article emerged in the context of ongoing dialogue and collaboration between the authors, who are researchers and practitioners engaged in attempts to create, manage, evaluate, and analyze ‘dialogue events’ in the United Kingdom and United States. The Center for Informal Learning and Schools (CILS) has provided the opportunity and medium to link the research and practice of ‘dialogue events’ by providing support for postgraduate students and post-doctoral researchers at King’s College London to enter into collaborative relationships with practitioners at three different ‘dialogue event’ sites: the Dana Centre at the Science Museum (London); the Darwin Centre at the Natural History Museum (London); and the Choices and Challenges Project at Virginia Tech (Blacksburg, VA, USA). The explorations in this article are thus grounded in our experiences in these two national contexts, as well as by the four overarching and interconnected themes of CILS research: (1) the means and structures of participating in informal learning; (2) the use of explanation, communication, and discourse in informal contexts in a range of settings; (3) the organizational structures, policies and agencies of those engaged in informal learning and their implications for practice; and (4) learning environments and their design.
