Theorizing on segmented assimilation has usefully spurred debate about the experiences and positions of the second generation in the US, and more recently, Europe. This theory has focused primarily on how young people fare in secondary school, and the crucial role that families and ethnic social networks can play in supporting second generation individuals. But what happens when young people leave home and enter into mainstream higher education institutions? Theorizing on segmented assimilation does not address either the implications of intermarriage for integration and upward mobility or how we should conceptualize the experiences of the growing numbers of 'mixed race' individuals. In this paper, I first consider the question of whether intermarriage is linked with upward mobility in the British context. I then explore the racial identifications and experiences of disparate types of 'mixed race' young people in Britain. How do such young people identify themselves, and what may their identifications reveal about their sense of belonging in Britain?

9
10 **Introduction**

11 Theorizing on segmented assimilation has usefully spurred debate about the experiences and positions of the
12 so-called 'new second generation' in the US, and more recently, in Europe. While this model has been
13 helpful in illuminating the diversification of integration pathways for different immigrant groups to the
14 USA, it has been criticized by analysts in both the US and Europe along various lines (see Thompson &
15 Crul 2007; Crul & Vermeulen 2003). The fact that SA theory may not be fully applicable to European cases,
16 however, may be an unreasonable test of its merits, given that it was developed specifically in relation to the
17 incorporation of post 1965 immigrants from mostly Latin America and Asia into the US. Nevertheless, with
18 the benefit of hindsight, it appears that theorizing on segmented assimilation (as exemplified by Portes &
19 Zhou 1993; Rumbaut & Portes 2001) is now in need of some refinement.
20
21
22
23
24
25
26
27
28
29
30

31 Segmented assimilation theory has primarily focused on how young people and adolescents fare in
32 secondary schooling and the crucial role of family (and ethnic social networks and resources) in supporting
33 second generation individuals. This theory essentially focuses on the second generation when they are
34 minors and adolescents, subject to their parents' influence and authority within the home. At the heart of
35 this theory is the contention that young people who delay assimilation into the mainstream (and who avert a
36 slippery slide into a minority underclass, or who avoid wholesale Americanization in White suburban
37 settings) are most likely to succeed in secondary schooling and enter onto a trajectory which can ensure
38 educational and socioeconomic success.
39
40
41
42
43
44
45
46
47
48

49 The benefits of ethnic retention are said to encourage the second generation in educational
50 achievement and high aspirations, while shielding them from mainstream influences which can weaken
51 coethnic ties and hinder educational achievement. This pathway is exemplified by the case of Cubans in
52 Miami and Punjabi Sikhs in suburban California (Portes & Zhou 1993). For example, in 'Valleyside', a
53 rural, predominantly White town in California, Gibson (1989) characterizes the selective assimilation
54 pattern of the Punjabi Sikhs as 'accommodation and acculturation without assimilation'. Gibson observes:

1
2
3 up their separate identity' (p. 24). The second generation Sikhs in Gibson's study tend to achieve academic
4
5 success and entry into good universities.
6

7
8 In the case of those who follow the 'selective assimilation' pathway - the one most likely to ensure
9
10 success - the story provided by SA implies that the trajectory into mainstream inclusion and success is
11
12 largely unproblematic and smooth, once young second generation individuals are successfully coached and
13
14 supported into good universities. But what happens *after* young people finish secondary education and leave
15
16 their family households? Many studies of the post-1965 second generation in the US have primarily focused
17
18 on either socioeconomic indicators or ethnic identity (Min & Kim 2009). But very little is known about their
19
20 dating and marriage patterns, and their implications for the emergence of a third generation (whether it be
21
22 'mixed' or not). One limitation of SA theory is the fact that while this theory focuses on second generation
23
24 minors and adolescents, and how they fare primarily in terms of economic incorporation, it does not attend
25
26 to the more social aspects of integration, when they leave school and make the transition into young
27
28 adulthood – a phase of young adulthood where they are typically faced with choices about potential
29
30 marriage partners, and about the meanings and salience of their ethnic and racial identities more generally.
31
32

33
34 Despite evidence of ethnic retention in studies such as by Gibson (1989) and Portes & Zhou (1993),
35
36 it would appear that parents' emphasis on selective assimilation has not hindered rates of intermarriage for
37
38 groups such as many Asian Americans and Latino Americans in the US, where the percentages of Asian or
39
40 Latino husbands or wives with spouses of another race or ethnicity surpassed 30% by the late 1990s, with
41
42 most of these married to a White partner (Bean & Stevens 2003, but see Min & Kim 2009). Therefore, what
43
44 happens in terms of the social networks and partnering of successful second generation young people
45
46 entering the mainstream (Joyner & Kao 2005)? And what do such interethnic unions, and the growth of
47
48 second and third generation multiracial people suggest for our understandings of 'integration' and
49
50 differential pathways? The parental strategy of 'selective assimilation' (ethnic retention) may, ironically,
51
52 lead second generation individuals into mainstream settings in which they will encounter a variety of
53
54 possible marriage partners, and will potentially encourage intermarriage.
55
56

57
58 Current demographic projections in Britain and even the US (according to Lee & Bean 2004, 20%
59
60 of Americans could identify themselves as multiracial by 2050 – not that distant a future) suggest that while
ethnic boundaries will not disappear overnight, they will grow ever more complex and blurred (Parker &

1
2
3 Song 2001). If this holds true, we need to track the social aftermath of SA theory, and we will need to
4 investigate the differential pathways for groups, as they marry, and have children. In other words, what
5 comes after segmented assimilation?
6
7
8

9
10 Theorizing on segmented assimilation does not address either the implications of intermarriage for
11 integration and upward mobility or how we should conceptualize the experiences of the growing numbers of
12 'mixed race' individuals. While there has been a long tradition of US scholarship which has addressed the
13 links between assimilation, upward (and downward) mobility (see Gans 1992), and intermarriage (see
14 below), research on these issues is still very nascent on the other side of the Atlantic. In this paper, I first
15 consider the question of whether intermarriage is linked with upward mobility in the British context.

Intermarriage is regarded by many analysts as the ultimate litmus test of 'integration' (see Warner & Srole 1945; Gordon 1964; Alba & Nee 2003; Lee & Bean 2004). Conversely, low rates of intermarriage have often been interpreted as an indicator of the maintenance of strong ethnic identities. Milton Gordon's (1964) book *Assimilation in American Life* develops an explicit link between the process of 'assimilation' and intermarriage, in which he argues that intermarriage is the *inevitable* outcome of what he calls 'structural assimilation'. The price of such assimilation, for Gordon, is the disappearance of the ethnic group as a separate entity and the evaporation of its distinctive values' (p. 81).

But as argued by theorists of SA, one can achieve upward mobility on the basis of limited acculturation – i.e. one can de-couple economic and social forms of assimilation – and that selective acculturation is conducive for upward mobility via adherence to ethnic norms conducive to educational success. While Gordon's study is dated, and largely focused on European immigrants to the USA (plus 'Negroes' and Puerto Ricans), his theoretical linking of intermarriage and integration has not been revised

1
2
3 or questioned by more recent analysts, including the proponents of segmented assimilation (though they
4 have clearly departed from theories of classical assimilation in other respects).
5
6

7
8 But in the increasingly complex landscape of many multiethnic societies, we must critically
9 examine what we mean by 'integration' in this formulation, including forms of both economic and social
10 integration (Song 2009; Lucassen & Laarman 2009). While intermarriage may be said to herald a form of
11 structural assimilation, in terms of one's formal inclusion in certain families, social networks, and social
12 institutions, we cannot assume that minority individuals (or couples) who have intermarried necessarily feel
13 welcomed, or that they straightforwardly 'belong' in mainstream settings. Nor should we assume that an
14 interracial partnership is automatically devoid of prejudice or racism within the couple relationship, the
15 wider family network, or indeed the wider society (see Luke & Luke 1998; Twine 2004; Rockquemore &
16 Laszloffy 2005). Large-scale intermarriage is an undeniable marker of a lessening of social distance
17 between two groups, but this decreasing social distance should not be understood as an unalloyed ticket to
18 social inclusion.
19
20
21
22
23
24
25
26
27
28
29
30

31
32 There is still very little known, empirically, about the lived experiences, and socioeconomic
33 outcomes of, intermarriage in contemporary societies such as Britain. While theorizing on SA is clear that
34 ethnic retention during adolescence promotes educational attainment (and thus, upward mobility), it does
35 not address the implications of second generation interracial partnering for economic mobility and social
36 integration/inclusion. Is intermarriage (with Whites) associated with economic mobility in Britain?
37
38
39
40
41

42
43 We are witnessing significant levels of intermarriage in Britain today. Not surprisingly, there is
44 general consensus among analysts that rates of intermarriage are substantially higher for the second
45 generation than for the first. However, as in the US, rates of intermarriage vary considerably across minority
46 groups, with Black Britons (especially men) exhibiting the highest rates of interracial partnering than any
47 other minority group – quite the opposite case with African Americans in the US. In a recent analysis of the
48 Labour Force Survey, nearly half of Black Caribbean men *in a partnership* were partnered with someone of
49 a different ethnic group (and about 1/3 of Black Caribbean women), while 39% of Chinese women in
50 partnerships had a partner from a different ethnic group (Platt 2009; Berthoud 2005).ⁱⁱ To provide some
51 sense of the burgeoning unions between White and non-White Britons, there are *more* 'mixed' Black
52 Carribean/White Britons under the age of 5 than children of this age with two Black Caribbean parents
53
54
55
56
57
58
59
60

1
2
3 (Owen 2007)! Thus, in Britain, the mixed population is comprised of both older second generation
4
5 individuals who are mixed, and younger third generation children.
6

7
8 Educational attainment has been found to influence rates of intermarriage among groups. In a
9
10 recent study using data from the General Household Survey (from 1988 to 2004), rates of intermarriage
11
12 were found to be higher for ethnic minorities with high educational qualifications (such as the British
13
14 Chinese), *except* for Blacks (Muttarak 2007a). In comparison with Black and Chinese Britons, but especially
15
16 Black Britons, South Asian Britons evidence low rates of intermarriage – even among second generation
17
18 Asians with higher educational attainment (though Indians intermarry at much higher rates than do
19
20 predominantly Muslim groups such as Pakistanis and Bangladeshis, and second generation Asian *women*
21
22 with high qualifications are most likely to intermarry). However, according to Berthoud (Berthoud 1999:51,
23
24 YCM study) intermarriages are roughly equally common among Black Caribbean men with high *and* low
25
26 levels of education, and among those with good and bad employment experiences. This latter study suggests
27
28 that there is considerable class diversity among Black Caribbean men who intermarry with White British
29
30 women. Therefore, educational attainment may or may not influence rates of intermarriage, depending upon
31
32 the specific group in question – clearly, more studies are needed in this area.
33
34

35
36 As for the relationship between intermarriage and upward mobility, the evidence is, again, mixed.
37
38 While Berthoud (2005) argues that intermarriage does not appear to benefit or penalize Black Caribbeans,
39
40 other research looking at occupational mobility and intermarriage in Britain suggests that ethnic minority
41
42 women in particular receive an ‘intermarriage premium’ (this premium is operationalized in terms of
43
44 occupational mobility by comparing occupational position in 1991 and 2001) when they partner with a
45
46 White Briton – though Black Britons receive the smallest premium (Muttarak 2007b). Cultural differences
47
48 generating normative pressures to remain endogamous can continue to play an important role in shaping the
49
50 partnering decisions of specific British minority groups. But rather than being beneficial for mobility, as
51
52 ‘selective acculturation’ is said to be in relation to SA, this South Asian endogamy (especially among
53
54 Muslims) may accompany patterns of ethnic residential segregation and relatively low socioeconomic
55
56 indicators.
57
58

59
60 As found with some Black Britons who intermarry with Whites, caution is needed in
automatically equating intermarriage with upward mobility. One difficulty in assessing possible upward

1
2
3 mobility and intermarriage is that mobility which coincides with intermarriage may be a by-product of
4
5 earlier social or economic mobility of the partners, or even of their parents (Gans 2007). And as discussed
6
7 above, studies which posit a relationship between intermarriage and upward mobility would not have
8
9 information about whether the couple have the support and 'connections' of either the minority or White
10
11 family and wider social networks. In this way, many assumptions are built into models linking intermarriage
12
13 and economic mobility.

14
15
16 Also, how have mixed people in Britain, the progeny of intermarriage, fared in socioeconomic
17
18 terms? A recent report by the Office of National Statistics (Bradford 2006) asks: Are mixed people more
19
20 like their minority counterparts, or their White counterparts (as the vast majority of mixed people have one
21
22 White parent)? This report found that those who identify as Black Caribbean/White are *less* likely to be in
23
24 professional occupations (20%) than (non-mixed) Black Caribbean (25%) or White Britons (27%) (Bradford
25
26 2006:24). Clearly, this finding goes against the implicit logic of assimilation, in which intermarriage with
27
28 Whites would normally be associated with upward mobility. The opposite is true for South Asian/White
29
30 mixed people, with a higher proportion of this group in the professions, in comparison with either South
31
32 Asian or White Britons – here, it would appear that those who are intermarried are a more elite subgroup of
33
34 South Asians. In fact, those who identified as White/South Asian were the most likely to be in managerial or
35
36 professional occupations (30%), while those with White/Black Caribbean identities were the least likely to
37
38 be in those occupations (20%) (Bradford 2006). Furthermore, those who were Black Caribbean/White were
39
40 the most likely to be unemployed (16%), while South Asian/White mixed people were the least likely
41
42 (10%). Therefore, disparate types of 'mixed' people exhibit different socioeconomic profiles. Thus, while
43
44 Black/White intermarriage is most prevalent in Britain, it appears that Black/White mixed individuals are
45
46 the most disadvantaged in socioeconomic terms, while South Asians are the least likely to intermarry, but
47
48 those who do intermarry are likely to have children who are more privileged than other groups.

49
50
51 Based on the figures above (though analysts are not entirely in agreement), there appears to be some
52
53 evidence that the projected scenario in SA (in the US), in which Black second generation groups are
54
55 particularly vulnerable to a downward trajectory, may be at least partially replicated among mixed
56
57 Black/White Britons (in terms of their employment profile), even though they are the 'products' of
58
59 intermarriage. Historically, the White working classes have partnered with the Black working class in
60

1
2
3 various metropolitan areas, ranging from London, Liverpool, and Bristol (Benson 1984). But as Berthoud
4 suggests, there is also now a growing segment of the Black middle class which is partnering with middle
5 class Whites as well.
6
7

8
9
10 The emergent patterns of intermarriage in Britain clearly have implications of intermarriage for a
11 new generation of 'mixed race' individuals, and their identities and sense of belonging. Although SA theory
12 has focused on the benefits of ethnic retention and coethnic affiliations for socioeconomic indicators, more
13 research in future will have to examine the complex and varied outcomes of second generation cohabitation
14 and marriage patterns (including coethnic and cross-generational partnerships – Min & Kim 2009).
15
16
17
18
19

20
21 As in the US, a multiracial third generation exists in Britain, but it is very young, with many
22 under age 10 (Owen 2007). There are, however, second generation multiracial young people who
23 have reached adulthood in Britain, and I now turn to my study of this population. 'Race' for many
24 second generation minorities can still act as a barrier to integration, but is this also the case for mixed
25 individuals? If they are neither White nor a monoracial minority, 'mixed' individuals cannot easily be
26 analyzed in terms of the segmented assimilation model – a model which is based upon the recognition
27 of distinct ethnic and racial boundaries between groups. In my discussion below, I focus primarily
28 upon mixed individuals with one Black parent, and those with one East Asian parent – the groups
29 which are seen to follow very different trajectories, according to SA. While concerns about ethnic
30 retention are evident among some mixed young people, their upbringing within a mixed family, and
31 in an increasingly multiethnic Britain, reveals three main ways in which they think about their
32 identities and 'belonging' in British society.
33

49

50 **Identifications of 'mixed race' young people in Britain**

51 Because intermarriage is believed to decrease the significance of cultural distinctiveness in future
52 generations, the children of such unions are less likely to identify themselves with a single ethnic or racial
53 group. A number of studies in the US (see Rochequemore & Brunnsma 2002; DaCosta 2007; Root 1996)
54 and UK (Tizard & Phoenix 1993; Ifekwunigwe 1998; Ali 2003) have already demonstrated the
55 emergence of multiracial identifications, which are distinctive from monoracial or monoethnic
56
57
58
59
60

1
2
3 identifications, though multiple identifications can be held simultaneously, or can be chosen in different
4 contexts (see Telles & Sue 2009 for a good review).
5
6

7 Overall, our knowledge about the diversity of the mixed population in Britain is limited, but
8 one reason why most research and policy has focused on the Black Caribbean/White and Black
9 African/White mixed groups is that these two part Black groups comprise the largest of the 677,000
10 (1.2% of the population) identified as 'mixed' in the last 2001 British Census. The South Asian/White
11 group and 'Other mixed' group (including most of the Chinese/White) constitute the next largest groups.ⁱⁱⁱ
12 The 'other mixed' category is heterogeneous, with many different identities, including mixed White
13 ethnic identities. However, these numbers are almost certainly an undercount, with some parents
14 designating their young children monoracially (Bradford 2006), as opposed to a multiracial categorization
15 (see Xie & Goyette 1997).
16
17
18
19
20
21
22
23
24
25
26

27 I now draw upon some of the findings of an Economic and Social Research Council
28 funded study of the racial identifications of different types of 'mixed race' young people in
29 Britain, including Black/White, East Asian/White, Arab/White, South Asian/White, and minority
30 mix (e.g. Black/Asian).^{iv} We adopted a cross-sectional study design, with the use of a semi-
31 structured online survey, followed by in-depth interviews with a sub-set of these survey
32 respondents. Young adults were recruited from universities and colleges of further education
33 across England (but primarily from London).^v A stratified sample (based on location and size of
34 the mixed race student population) was drawn from a sampling frame that integrated ethnically-
35 coded data for students in universities and colleges supplied by the Higher Education Statistics
36 Agency and the Learning and Skills Council. These institutions sent out an email (with a link to
37 our online survey) to its student body. We were able to include 326 of the roughly 500 surveys
38 returned to us. Survey respondents were asked a variety of open and close-ended questions about
39 their ethnic and racial identifications. Of these 326 survey respondents, we obtained a sub-sample
40 of 65 young people for in-depth interviews (27 men, 38 women).^{vi} Respondents in the sub-sample
41 of 65 were then interviewed about their understandings and experiences of their racial and ethnic
42 identifications in more detail – usually within 1 to 2 months after the completion of the online
43 survey.

Various US studies of multiracial people have found that part Black ‘mixed’ people may be more constrained in their racial identifications (and categorized as ‘Black’) than are other ‘mixed’ groups, such as East Asian and White people in the US, whose choices of a ‘best single race’ were more variable than those of part Black individuals (see Harris & Sim 2002; Herman 2004; Xie & Goyette 1997; Tashiro 2002). We were particularly interested to see how mixed individuals would respond to the instruction to *choose only one group (to which they felt they most belonged)*, and anticipated their responses to reveal how they thought about race and issues of belonging. Would respondents choose one group, or would they insist upon being multiracial? The remainder of this paper focuses upon the interview responses to the question about a ‘best single race’. This paper draws solely on the interview subset (n=65) because these interviews provided the rich, qualitative material which illuminated the complexity and nuances surrounding racial and ethnic identification – something not easily captured in the online survey on its own. While we cannot make any systematic comparisons between the 5 different groups, given the small and variable number of interviewees in each group, this section provides an *exploratory* examination of how different types of multiracial individuals think about, and experience, their racial identifications in their everyday social interactions with others.

White, British, European, Irish

In response to the instruction to choose one group, respondents used a variety of racial and ethno-national terms which I included under one category. Almost half of the interview sample (33 of 65) chose terms such as ‘White’ (11), ‘British’ (10), ‘White British’ (6), ‘European’ (3), ‘Irish’ (2), and ‘English’ (1). Although terms such as ‘White’, ‘British’, ‘European’ and ‘Irish’ are not equivalent terms, they were grouped together, because, as I explain below, these respondents conveyed very similar meanings through the use of these terms.

A striking 15 of 16 of the East Asian/White respondents, most of the South Asian/White respondents (8 of 10), and just over half (8 of 15) of the Arab/White respondents chose terms within this category – as opposed to only 2 of 17 Black/White, and no ‘minority mix’ respondents. So how should we interpret these chosen identifications? We found that most of

1
2
3 these respondents distanced themselves from the idea of being *racially* White (Song, forthcoming
4 2010). The term British was considered by many respondents to be an inclusive, race neutral term
5 which denoted cultural belonging, and which could complement one's ethnic or racial ancestry.
6
7 For most of these respondents, identifying White (or British) as the group that contributes most
8 strongly to their identity meant that they were first and foremost British in *cultural terms*. All of
9 these respondents articulated a strong sense of feeling British, as they had grown up in Britain,
10 with a predominantly British upbringing. They reported that they were comfortable and rooted in
11 British culture, especially if they had had little exposure to their minority culture and background.
12
13 Given that they had grown up in Britain, the still predominantly White mainstream culture loomed
14 large. This understanding of British or White differs from the more delimited understanding of
15 White (as a racial identity) in most US studies. For example, Paul (Chinese/English), chose 'Irish
16 (or European)' as his 'best single race' in the survey, and explained that, '*My English is better*
17 *than my Chinese, I look more Western than Asian, and I was educated in the West*'. But his
18 interview also revealed that he sometimes called himself 'British', and saw himself first and
19 foremost as a 'Eurasian' person who, despite his predominantly European upbringing, was deeply
20 interested in his Chinese heritage.
21
22

23
24
25
26
27
28
29
30
31
32
33
34
35
36
37
38 In addition to the multiplicity and fluidity of identifications Paul articulated, there was
39 often a blurring around the use of racial (White), ethnic (Chinese), and national (Irish or British)
40 categories. Even though Paul did not feel straightforwardly Irish or European, he felt much more
41 European, or Western, *culturally*, than he did Chinese, given his upbringing in Ireland and
42 England. For Paul, being both Chinese and English did not in any way preclude his sense of
43 belonging in White mainstream Britain – as experienced, for instance by some second generation
44 groups in the US.
45
46
47
48
49
50
51
52

53
54 Mohammed (19) had an Egyptian father and Irish mother. He grew up in London, and
55 he also stressed inclusive understandings of what it meant to be British:
56
57
58
59
60

1
2
3 *It's wherever you're born. It's home for me.....Um, I don't think color is It's if you speak the*
4 *language, you're part of the culture...there's a new culture emerging in London, Britain, just the*
5 *youth culture, urban.*
6
7
8

9
10 Mohammed explained that choosing the term British transcended any narrow notion of
11 race, and that this term incorporated everyone who had grown up in the cultural melange he
12 experienced in London. Respondents who had grown up in London tended to articulate a
13 hybridized, cosmopolitan view of culture and belonging, while race was regarded as of decreasing
14 importance.
15
16
17
18
19

20 A number of those who had chosen White also conveyed a strong sense of being 'mixed
21 race'. For instance, Jane (29) (of Chinese and English descent) chose 'White?', but in her
22 interview, she revealed that she had chosen 'White?' because (like Paul) she had had little
23 knowledge of Chinese culture or dialects. Jane reported that she felt neither Chinese, nor White,
24 but that she felt both 'mixed' and British. Her strong sense of belonging in Britain did not hinge
25 upon her ability to locate herself clearly into a definitive ethnic and racial taxonomy.
26
27
28
29
30
31
32

33 In a minority of cases, choosing White or British was in spite of, or because of, racism
34 throughout their lives. One respondent, George (25), who was Chinese and English, chose 'White
35 British', even though (or because) he was always seen as Chinese. George grew up with numerous
36 experiences of racism, in which he was taunted for looking 'foreign'. He reported that while he
37 felt very British in his upbringing and values, he did not believe that such an identity was
38 validated by others. George tended to experience his mixedness in a predominantly negative way;
39 he did not want to be seen as foreign, and the meanings attributed to his putative foreignness made
40 him feel objectified and devalued. Thus phenoytpe was central to how mixed respondents were
41 able to choose and assert their ethnic options, including the extent to which their chosen
42 identifications were validated by others (Waters 1990).
43
44
45
46
47
48
49
50
51
52
53
54

55 While some respondents experienced their mixedness in primarily positive ways,
56 others' experiences were less positive. Clearly, group differences applied in terms of which types
57 of mixed people felt that they could claim a White or British identity. East Asian/White and South
58 Asian/White (and to a lesser extent, Arab/White) respondents were the most likely to claim
59
60

1
2
3 'White' (or 'British') as their 'best single race', while very few Black people chose 'White' or
4
5 'British' as the group which most strongly contributed to their sense of selves (though in
6
7 interviews this did not mean that part Black respondents did not feel British in cultural terms). The
8
9 majority of the interview sub-sample emphasized a strong sense of belonging in Britain, coupled
10
11 with a largely symbolic attachment to their minority cultural background. Thus, claiming a racial
12
13 identification, e.g. as White, Indian, or Black, did not preclude also feeling British, and regarding
14
15 Britain as their home. These terms were clearly not mutually exclusive, and the interviews
16
17 pointed to the multiple locations of belonging and identification articulated by these respondents.
18
19
20
21

22 Minority heritage

23
24 Seventeen (of 65) respondents nominated one non-White group as their 'best single race': 7
25
26 Black/White respondents chose Black, 4 Arab/White respondents chose Arab, 1 East Asian/White
27
28 respondent chose East Asian, 1 South Asian/White chose Asian, and 4 'minority mix' chose one
29
30 heritage over the other. In comparison with the 33 respondents who chose White (or a cognate
31
32 term), which primarily referred to their cultural upbringing in Britain, the assertion of a minority
33
34 identity appeared to be pointed, though what exactly was being asserted could vary considerably
35
36 in meaning. In some cases, an assertion of a non-White identification was linked to experiences of
37
38 racial prejudice and a sense of being a racialized minority. For instance, Joan (25) had an Iranian
39
40 father and an English mother. When asked why she chose 'Iranian', she said, *'I feel more close to*
41
42 *their customs, and their beliefs and the people, to be honest... rather than English.'* In the course
43
44 of the interview, Joan also spoke of the many experiences of racial prejudice she had experienced
45
46 when she was growing up. Her attachment to Iranian culture and practices, in addition to her
47
48 experiences of racism ('they'd just call me Arab; it was just so horrible...I felt like a real outcaste,
49
50 yeah') meant that she did not feel able to claim White or British as the group to which she most
51
52 belonged.
53
54
55

56
57 Significantly, 7 of 17 Black/White respondents chose 'Black' (versus 2 Black/White
58
59 who chose 'White'). For instance, Keith (19), who had a White English mother and a Black
60
Jamaican father, chose 'minority (Black)'. He revealed that, especially in public settings, he had

1
2
3 experienced various forms of racial prejudice as a Black man. The cumulative nature of these
4
5 experiences with the White world reinforced his sense of being Black, even though he
6
7 acknowledged his mixed heritage. Keith reported that some years ago, when asked what his
8
9 nationality was by a bank teller, he had replied, 'English' – only to have an older White man
10
11 retort, 'You're not English!' This incident had shocked and upset Keith, and since then, he said
12
13 that he did not feel he could claim Englishness, even though his mother was English, and he had
14
15 been raised in England. The realization that he was seen as Black (as opposed to mixed or
16
17 English) reinforced his sense of being not only negatively valued, but at the margins of
18
19 mainstream society.
20
21

22
23 However, Keith's (and Joan's) experience was in the minority in the interview sample.
24
25 In comparison with Keith, who emphasized a sense of racialized minority disadvantage, most of
26
27 the other part Black respondents who nominated 'Black' did not refer to experiences of racial
28
29 prejudice per se, though many of them mentioned that they were often racially assigned as
30
31 'Black'. In other words, the part Black respondents reported a more limited sense of their ethnic
32
33 options, given societal tendencies to see them as monoracially Black. Nevertheless, most of these
34
35 respondents emphasized their pride in a Black Caribbean or Black African cultural background – a
36
37 background which did not compromise their sense of belonging in British society. For instance,
38
39 Sarah (21) came from a middle class family, and attended an elite university in Britain. She was
40
41 wholly positive about her mixed Black Caribbean/English heritage, and claimed 'Barbadian' as
42
43 her 'best single race': 'When I say to people, oh my dad is from Barbados, they're like, wow,
44
45 really? That's so cool! I'm like, that is quite cool, actually.' For Sarah, there was no tension
46
47 between claiming a Black, and mixed identification. At the same time, choosing 'Barbadian' did
48
49 not appear to preclude a strong sense of belonging in Britain.
50
51

52
53 Nevertheless, some of the Black/White respondents articulated concerns about the
54
55 negative values and images associated with Blackness which they encountered in their day to day
56
57 lives, and the fact that people tended to see them as Black, without acknowledgment of their
58
59 mixed background. While a few respondents associated racism with their assertion of non-white
60
61 race, most respondents who reported a non-White 'single best race' (especially middle class

1
2
3 respondents) spoke of these identifications as a symbolic and celebratory assertion of difference,
4
5 rather than a badge of minority marginality.
6
7
8

9
10 Can't choose one race

11 Of our 65 interview respondents, 15 could not, or would not, choose one racial/ethnic group in the
12 survey, and ticked 'can't say'. The two most common reasons for this were that a) respondents
13 reported that they did not identify at all along racial lines; b) respondents felt genuinely 'mixed
14 race', and would not choose one part of their heritage over the other. These respondents appeared
15 to adopt a principled refusal to choose one single race. In comparison with the other types of
16 mixed groups, a larger proportion of Black and White young people reported that they were
17 unable or unwilling to choose a single race.
18
19
20
21
22
23
24
25
26

27 Four respondents reported that they simply did not identify along racial lines. These
28 respondents reported that their 'race' and their multiracial heritage was unimportant, like Richard
29 (19), who had one Portuguese and one Pakistani parent. Although he was not seen as White by
30 others, he reported that his 'mixed' status did not affect his day to day existence: 'I mean, no one
31 cares [if you're different]'. Although Richard was interested in and valued his cultural heritage on
32 both sides, he simply did not identify in racial terms. When asked about his cultural upbringing, it
33 became evident that Richard's parents had de-emphasized the idea of ethnic or racial difference in
34 their family: *Basically what they did, my dad doesn't speak Portuguese, my mum doesn't speak*
35 *Urdu, she learnt a few words here and there.... So they just raised me as neutral, which is British*
36 *really.... I just don't think they were that bothered about it.*
37
38
39
40
41
42
43
44
45
46
47
48

49 Beth (25), who had a Black African mother and White English father, explained that she
50 rarely thought about 'race': *'I personally forget most of the time that I have an ethnicity, but I am*
51 *lucky to have been successful academically and study in a world where I don't feel that such*
52 *things are important.'* These respondents reported that race was just not a central way in which
53 they thought of themselves – that some other attribute was far more central to their lives – like a
54 hobby, what they were studying, or their religion.
55
56
57
58
59
60

1
2
3 Among those who insisted upon a mixed, as opposed to singular, racial identity, 6
4
5 Black/White respondents talked about the importance of having their mixed status recognized; this
6
7 was because many people (of all backgrounds) would see them as monoracially Black. This forced
8
9 inclusion into the collective category 'Black' meant that they had to deny their White heritage (see
10
11 Zack 1996). All 6 of the Black/White respondents claiming a multiracial identity were women.
12
13 While we cannot explore this finding more fully in this paper, it may be that part Black men are
14
15 even more normatively constrained from claiming a mixed heritage than are women. Interestingly,
16
17 while Black/White respondents were most consistently racially assigned by others (as Black), they
18
19 were also the most likely to claim a multiracial, as opposed to a monoracial, identification. Many
20
21 of the respondents who insisted upon a mixed identification articulated some of the most
22
23 impassioned views about the centrality of their mixedness, to their sense of selves.
24
25
26
27
28

29 **Conclusion**

30
31 Despite various criticisms, theorizing on segmented assimilation has been invaluable in documenting the
32
33 differential pathways taken by various second generation groups. However, as the new second generation
34
35 has matured, we need to explore what happens when second generation young people leave home, and enter
36
37 into mainstream settings, where they will make choices about friendships and encounter potential marriage
38
39 partners. Thus, in this paper, I have first discussed the implications of intermarriage in Britain for the
40
41 potential integration and mobility of minority young people. Second, I have examined the question of how
42
43 multiracial (as opposed to monoracial minority) young people in Britain identify themselves, and what these
44
45 identifications tell us about their senses of belonging in Britain.
46
47
48

49 As I have argued above, evidence about the socioeconomic positions and experiences of
50
51 intermarried couples in Britain is still emerging, and the dividends of intermarriage may vary for disparate
52
53 groups of variable class and educational backgrounds. While some analysts argue that Black/White unions
54
55 (which are most common in Britain) are just as likely for individuals with little as well as high levels of
56
57 educational attainment, others argue that educational attainment is inversely related to the propensity to
58
59 intermarry in the case of Black Britons (unlike the case of South Asian and Chinese Britons). In Britain, it
60

1
2
3 appears that norms of religious and ethnic endogamy remain strong for many South Asian Britons,
4
5 translating into lower rates of intermarriage for them, overall, than for Black or Chinese Britons, even when
6
7 educational attainment is taken into account.
8

9
10 In the US, according to SA, the Black second generation is most racially segregated and
11
12 vulnerable to downward mobility. In Britain, we find a rather different scenario, with long-standing mixed
13
14 social networks and neighborhoods in metropolitan areas and relatively high rates of Black/White
15
16 intermarriage. Rather surprisingly, mixed Black/White (the offspring of intermarriage) individuals, on
17
18 aggregate, appear to be doing *less* well than Black or White counterparts in the labor market (ONS 2006).
19
20 Although mixed South Asian/White individuals in Britain fare better in the labor market than do non-mixed
21
22 South Asians as a whole, we need to temper the tendency to automatically link intermarriage (with Whites)
23
24 with economic and social mobility and integration. Over time, British studies also need to investigate more
25
26 fully patterns of coethnic partnership (see Min & Kim 2009) and their implications for our understandings
27
28 of integration and belonging (Song 2009).
29
30

31
32 Thus intermarriage may or may not enhance upward mobility in specific ways, depending upon
33
34 the group (or sub-group) in question. According to a variety of measures, many British minorities are
35
36 performing better than their White peers, such as in educational attainment (Modood 2004), and
37
38 increasingly, there is concern about the position of the White working classes (Runnymede Trust 2009).
39
40 Many analysts of integration, who seem to presume that intermarriage is the final outcome of the
41
42 'assimilation' process, may be overly sanguine about what intermarriage (with Whites) implies in terms of
43
44 economic and social integration, and need to consider the class backgrounds of both minority partners and
45
46 the White people they marry.
47
48

49
50 And while SA theory has primarily conceived of the mainstream as White and middle class, the
51
52 growth of intermarriage and multiracial individuals (not just in the US, but in many other multiethnic
53
54 societies, such as Britain) necessitates a reformulation of the so-called mainstream (Alba & Nee 2003;
55
56 Waters 1999), and of ethnic and racial boundaries more generally. Regarding the identifications and
57
58 experiences of disparate types of multiracial Britons, a significant degree of intra-group diversity emerged,
59
60 even among Black/White and East Asian/White individuals, whose experiences and understandings of their
mixed status depended a great deal upon their physical appearance, their class backgrounds, and the ethnic

1
2
3 composition of the places in which they grew up. Across all the types of mixed people, however, many of
4
5 the multiracial respondents felt that they were part of a mainstream culture (which could be predominantly
6
7 White in specific regions/settings, while for others, being part of the mainstream could mean being part of a
8
9 multiethnic, culturally hybrid locality and culture, as was found in many parts of London and other
10
11 metropolitan areas). For many (though not all) mixed young people, questions about ethnic retention were
12
13 largely moot – growing up in Britain, and with one White parent, attachment to a minority culture and
14
15 sensibility was primarily symbolic.
16
17

18
19 But like their non-mixed second generation counterparts in SA, these mixed young people in
20
21 Britain did have to decide what, if anything, their ‘race’ and mixedness meant. As discussed above, the
22
23 categories and terms respondents chose to describe themselves required interpretation, and did not speak for
24
25 themselves, as they could signify a variety of meanings and experiences, even within one type of mixed
26
27 group. Almost half of the respondents (comprised of many of the East Asian/White respondents) chose
28
29 White or British as their ‘best single race’, and in doing so, were making assertions, not about being White
30
31 racially, but about belonging in Britain. Overall, these multiracial respondents exemplify a multicultural
32
33 sensibility in which race-neutral understandings of national belonging are often emphasized in conjunction
34
35 with, or as being more important than, a recognition of ethnic and racial identity derived from one’s
36
37 parentage. However, assertions of belonging, or of being British, were not always validated by others,
38
39 especially for some respondents who were seen as visibly different.
40
41

42
43 Our Black/White respondents differed from our non-Black respondents in their greater propensity
44
45 to choose a minority race (Black). However, most of those who chose Black also professed to feeling
46
47 British, and while a few respondents associated their choice with a disadvantaged minority status, most
48
49 made positive and symbolic assertions of their Black heritage. There was also a surprising degree of
50
51 diversity even among Black/White respondents, including the significant number of women who insisted
52
53 upon a multiracial identification, and those who refused a racial designation altogether. It is clear that class
54
55 background and resources will continue to play an important role in mediating one’s experiences of
56
57 multiraciality, perhaps most significantly in relation to Black/White individuals, given the substantial
58
59 growth in Black/White mixed people in Britain across both working and middle class backgrounds.
60

1
2
3 In Britain, multiracial individuals are part of an increasingly ethnically and racially diverse
4 landscape, in which the significance of ethnic or racial difference will vary according to specific contexts
5 and situations. Being mixed was reported to be quite 'ordinary' for many multiracial respondents, especially
6 in metropolitan settings where ethnic diversity was considered the norm. Though I do not wish to overstate
7 this point, the very choices that these multiracial individuals perceive about their friendships and partners,
8 social networks, and cultural affiliations are now less determined by the recognition of meaningful ethnic
9 and racial boundaries – and this may even be true for many non-mixed second generation young people in
10 metropolitan settings.

11
12 The growth of mixed people also necessitates a reconsideration of 'the' group experience, as
13 multiracial people do not (yet) comprise a discrete group of people in Britain, given the great deal of
14 diversity in the racial identifications and experiences of mixed people, whether they are Black
15 Caribbean/White or Chinese/White. Just as intermarriage (with Whites) may not always signal outright
16 inclusion and mobility, the experiences of multiracial individuals may be highly variable, with some
17 experiencing their mixedness in predominantly positive ways, while others, especially from a working class
18 background, may perceive prejudice and various barriers because of their mixed ancestry (Tizard & Phoenix
19 1993).

20
21 Future studies of intermarriage and of 'mixed race' people must grapple with other theoretical
22 and methodological difficulties: how should we classify the marriages of mixed people (the offspring of
23 intermarriages)? Is it intermarriage if, for instance, a mixed Chinese/English person marries a White person,
24 or would this count as a marriage between two members of the majority society? If this same mixed person
25 married someone who was 'purely' of Chinese heritage, would this, then, count as intermarriage? Related to
26 the emerging complexity of classifying mixed people and their unions, growing 'super-diversity' (Vertovec
27 2007) more generally will pose methodological and theoretical challenges for any claims which link
28 intermarriage and integration (or upward mobility). Related to this, do we categorize someone as 'mixed' if
29 they have one minority grandparent (thus a mixed parent)? Should such a person be called 'second
30 generation mixed'? How far back, generationally should we go in marking 'mixture' before the whole
31 exercise becomes meaningless?

These seemingly distant questions about classification and categories are actually much more pressing than we may realize, if current demographic projections about mixing are borne out. What we mean by integration, and assumptions about the social distance between ethnic and racial groups, will need far more fine tuning, with the growing multiple pathways and outcomes experienced by monoracial and multiracial people within multiethnic Western societies. Thus we need to look beyond the horizons outlined by SA – a theory which relies upon the existence of clear and relatively stable ethnic and racial boundaries. In Britain, it is possible that, by the time we reach the maturation of a ‘third generation’ of mixed individuals, the whole notion of mixture will have become even more ordinary. In fact, in many (albeit variable) contexts within metropolitan Britain, the force of ‘race’ as a master status and identity (as opposed to other axes of identification) may be increasingly questionable.

44 ⁱ I would like to thank Maurice Crul and Jens Schneider, the editors of this special issue, for their valuable
45 suggestions.
46

47 ⁱⁱ Platt's analysis of the Labour Force Survey notes that 'inter-ethnic partnerships are defined as those where
48 one partner regards themselves as belonging to a different one of the 15 ethnic group categories to that
49 claimed by the other partner' (p. 13). Given the wide range of 15 ethnic groups, interethnic unions were not
50 necessarily ones involving a White partner, though many of them probably do. Also, only a third of Black
51 Caribbean women and something over half of Black Caribbean men are married or cohabiting (Platt 2009).
52

53 ⁱⁱⁱ Most of this Black group (316,000) is comprised of Black Caribbean/White individuals.

54 ^{iv} This ESRC funded project, 'The ethnic options of mixed race people in Britain, was conducted with Peter
55 Aspinall and Ferhana Hashem (both from CHSS, University of Kent), and was carried out between March
56 2006 and July 2008.
57

58 ^v In fact, 33% of mixed people in Britain lived in London in 2001 when the Census was taken (Bradford
59 2006). Most of the respondents were between 18 and 29, with 258 women and 68 men. This significant
60 gender imbalance mirrors the gendered patterns of participation found in other studies of mixed race.
