ABSTRACT

Objective: This study aimed to characterize the national scientific evidence of the last ten years about Florence Nightingale and the vital power and its applicability in nursing, and identify the concepts of vital power. 

Methods: It is an integrative review of the full national literature articles, through four databases. Seven articles were selected after applying the inclusion and exclusion criteria. Analysis of the issues on the legacy of Florence and the action of the internal and external environment on the vital power emerged.

Results: Most studies focused on the environment of inclusion of the individual as the vital power and strengthen this classified as inner strength.

Conclusion: Nursing professionals play an essential role in observing about keeping the environment where the patient is inserted, favoring the strengthening of the vital power, highlighting the presence of the companion as strengthening this vital power in the hospitalization process.

Descriptors: Postpartum period, Parturition, Nursing.
RESUMEN

Objetivo: Caracterizar las evidencias científicas nacionales de los últimos diez años sobre Florence Nightingale y el poder vital y su aplicabilidad en la enfermería, además de identificar los conceptos sobre poder vital. Método: Revisión integrativa de la literatura de artículos nacionales completos, por medio de cuatro bases de datos. Se seleccionaron artículos sobre el poder vital. Resultados: La mayoría de los estudios se centraron en el ambiente de inserción del individuo como fortalecer el poder vital y esta clasificada como fuerza interior. Conclusión: Los profesionales de enfermería ocupan un papel imprescindible en la observación en mantener el ambiente donde el paciente está insertado. La búsqueda de la enfermera determina el fortalecimiento del poder vital, destacando la presencia del acompañante según la fortaleza de este poder vital en el proceso de hospitalización.

Descritores: Puerperio, Parto, Enfermagem.

INTRODUCTION

Nursing is a health profession recognized since the mid-nineteenth century, and in front of this recognition presents a historical walk of intense search, going from empirical to scientific and increasingly seeking out studies on various themes related to the profession and in many of these studies stand out with innovative techniques to combat situations that affect health in order to strengthen discipline as scientific and to support daily practice.

The search on health promotion began with Florence Nightingale, where all her contributions to the professionalization of nursing are referenced in several studies, and therefore has an essential role in the history and the search for the qualification of care, being able to support theory and practice with skill, using both simple and feasible measures in their professional performance.

Among the many legacies left by Florence Nightingale and that guide nursing, we will emphasize the vital power, characterized as an innate force that exists in humans, and is used by them to experience the health-disease process, which is strengthened or not, as the situations that arise in the environment where they are inserted. Nursing can not be limited to only a practice of technicalities, but must advance on significant issues such as creating means for strengthening the vital force. “The proper use of fresh air, light, heat, cleanliness, calm, proper selection and diet administration should be such that the patient does not dispense their vital energy” and therefore nursing should use properly and with good sense, all that is present in the environment of this individual, both physical as well as social and psychological, treating them as being individual and unique, promoting the lowest expenditure of vital energy.

Thus, it is defined as a matter of research, which are the scientific evidence of the last ten years about Florence Nightingale and the vital power, and its applicability in nursing. As the object of study there is national scientific evidence about Florence Nightingale and the vital power and its applicability in nursing. And the objective is to characterize the national scientific evidence of the last ten years about Florence Nightingale and the vital power and its applicability in nursing, and identify the concepts of vital power.

METHODS

This is an integrative review study of literature, based on the steps of Ganong, which enabled the pursuit of national studies that worked with the theme of vital power and its applicability in nursing, seeking greater guidance about the research related to the theme, as well as reflection for future studies.

The research was conducted based on the following steps of the integrative review: issue identification and selection of the hypothesis or research question, establishing criteria for including and excluding studies/sampling or searching the literature, definition of information to be extracted from studies selected/categorization of studies, evaluation of the studies included in the integrative review, interpretation of results, presentation of review/knowledge synthesis.

In this article, the inclusion criteria to guide the search and selections of publications were:

a) Articles in national scientific journals, published in Portuguese, which addressed the subject of vital power in the interpretation of Florence Nightingale and applicability in nursing;

b) Published from 2004 to 2014, ie the last ten years, Considering the necessity of a current review on the subject;

c) Indexed by at least one of the Latin American databases and Caribbean Health Sciences (LILACS), Nursing Database (BDENF), or in the Scientific Electronic Library Online (SciELO) and Virtual Library in Health (BVS);

d) Locatable by the keywords “vital power”, “Florence Nightingale” and the following registered descriptors in the Descriptors Portal of Health Sciences (DeCS): “puerperal”, “birth”, “companion”, “nurses”. Initially
with the research in Descriptors of Health Sciences (DeCS), it was not found as a descriptor vital power, but vitalism, this however is not related to the topic discussed. Also we found as a descriptor vital cycle, and this relates to studies on the stage of life of children, adolescents and the elderly, but not to the purpose of the research.

Given this reality we chose to make direct searches in online databases with the keyword vital power and found articles related to escorts, birth, the perception of the mother, and the professionalization of the health team. There was a new search, which found the vital power related to hospitalization focusing on religion and individual beliefs, including childbirth related situations, but not to the legacy of Florence Nightingale, which did not allow us to include in this research. Even after this new search the selected articles were mostly focused on the area of women’s health and they experiencing situations related to childbirth.

Exclusion criteria were:

a) Publications not available in full text;

b) Publications presenting full-text availability, but whose link presented errors when attempting to access it;

Data collection was conducted from March to July 2014 and after classification and theme delimitation a full reading of seven articles found was held, which showed relation to the focus of this research approach to the writings of Florence Nightingale, the vital power and its applicability in nursing.

RESULTS AND DISCUSSION

It was observed after the reading of the articles that the subject vital power was used in these studies in order to relate it to issues where the internal and external environment influences the individual, leading them to a situation of restoration of the health-disease process.

After analysis, an articles division was made as to the themes that were related and divided into 2 categories. Table 1 reveals the items found in the category, the legacy of Florence Nightingale and its relation with the vital power in the health-disease process; and Table 2, the vital power related to care during labor, delivery and postpartum, nursing actions and presence of the companion.

**Legacy of Florence Nightingale and its relationship with the vital power in the health-disease process.**

The vital power is characterized as an inner strength and innate to human beings and that can be leveraged by internal and external factors acting on the restoration of health.47

The legacy of Florence Nightingale is based on the mobilization of the environment, both physical, social and psychological of the individual, to assist in the healing process. The role of nursing staff for this purpose should be focused on strengthening this force, leading them to recover from the disease.47

While “care”, nursing should be used in unique and humanized forms of strategies, working “together for humans, aiming at intensifying its vital power and awakening or strengthening the need to face the opponent, or hospital infection.” Its applicability was analyzed through observations in interpersonal relationships, comfort, welfare and conditions offered by the environment and by the nursing staff in hospitals, particularly maternity clinics, which showed in their care, postpartum women who developed puerperal infection and subsequent maternal death.

Besides the need for the nursing staff to conduct a more humanized care, the presence of the companion was regarded as one of the vital power favoring the puerperal woman, not with the obligation to do so, but for his presence beside her.4 The participation of nursing as a positive factor in the vital power was developed with the need for care professionalization, that following the approach and recognition given by Florence Nightingale, should be performed by qualified professionals with training and knowledge required, and this nursing care should “promote life, the life potential, the welfare of human beings in their individuality, complexity and comprehensiveness.”46

Therefore, there is a reflexive articulation about work, discipline and profession, with the conclusion that nursing...
should be represented by professionals with differential to develop in their practice technically competent actions in any situation of service and run them protectively, while its applicability can then be made in any hospital situation. The presence of the nursing staff was also assessed as necessary, to establish a balance by means of insertion of the patient and essential in maintaining your vital energy in the disease recovery process, and this means both physical, psychological and social.5,7

The vital power was evaluated as a source necessary in the evolution of labor, making this the most natural driven and less intervention. Its applicability was developed through observation as to the health team, to promote the environment with respect to the delivery process through privacy, the partner’s presence, a welcoming environment free of noise and unnecessary sounds, maintaining natural brightness, and the presence of the nurse providing security, attention, food, hygiene and comfort through individualized care with the individual knowledge of women there present.5

Associating the writings of Florence Nightingale as to the vital power, non-invasive actions in care in obstetric nursing, favors the development of the physiology of labor and birth. This is present in the promotion of a suitable environment and strengthening the autonomy of the mother, raising her inner strength and decreasing the cost of the energy needed for healing.7

The vital power related to care during labor, delivery and postpartum, nursing actions and presence of the companion.

The presence of the companion during the process of labor and health team performance in care through the humanization of care in both direct assistance as in the promotion of a suitable environment was evaluated in hospitals in rooming with puerperal women.1,8

The comfort provided by the nursing team for the woman in labor and delivery promotes advantages such as recovery of strength, personal power, spirit, welfare, growth, ability to mobilize coping mechanisms, the performance of usual roles, improving the quality of life and adaptation to the situation experienced, which will directly influence on the vital power of women, leading to the advantage of their immune system.1

This professional practice should be focused throughout the process of pregnancy, for better preparation of these women, not only in scientific and technical part, but also ethically and morally.1,8 To restore the vital power provides comfort and safety by making these women protagonists of this point in their lives.

Regarding the presence of factors that enhance or weaken the vital power of puerperal, these do not relate only in hospitals, but where they are inserted, that is, in their natural environment.9 The applicability through monitoring of puerperal at home as the subjective variables are reported as the presence of a family, respect for the culture and beliefs by nursing stimulus as to the care of the baby for that puerperal, and the objective variables such as nursing consultation, feeding guidelines, hygiene, observation of situations related to breastfeeding and engorged breasts.2

The care considered as a way to provide a moment of “interaction between those who care and who are cared, or awakens and strengthens the vital energy responsible for the restorative process,”9 when these variables are identified in the environment, it can prevent unnecessary waste of vital energy.2 The role of nursing is demonstrated as essential in facilitating an appropriate environment by promoting the presence of the companion, which as reported plays an important role in strengthening the vital power of the woman in labor and postpartum women.

But nursing should be attentive to give necessary support so that it can develop effective participation at that time, through better communication, information and mainly monitoring the team in adverse situations that lead to the weakening of the vital power.

**CONCLUSION**

Nursing productions of the last ten years have demonstrated the importance of the legacy of Florence Nightingale, the role of the nursing team and everything that is inserted in the internal or external environment, not only related to the structure, but also the emotional and social. For that, nursing plays an important role in fostering that environment, and should be seen by these professionals as part of a service not only technicalist, but mainly humanized.

The means to mobilize the internal or external environment offered for favoring the vital power and used in the delivery process, delivery and postpartum is shown as potentiating agents or disempowering in respect of hospitalization process, strengthening the idea
of greater awareness of the nursing staff as to their role in the interconnection of the hospitalized individual and the environment in which it is inserted, and especially the need to implement a humanized care.

Humanized care is related to the care in labor legislation and one of them implemented in 2005 which addresses the right of pregnant women to have the presence of a companion of her choice during labor, delivery and postpartum. For pregnant women, this participation has generated comfort and safety factors, then being imperative the need of nursing to work in their profession with an overview evaluating the insertion environment of the mother and what is needed to improve it in order to support their autonomy on delivery.

As for the view of nursing as a discipline, profession and work, it is clear that as a discipline it deals of care in the sense previously developed and quoted by Florence Nightingale, when she relates to nursing a profession that must go beyond the completion of technical procedures and look at not only one part of the disease, but with the whole vision for the provision of care.

We therefore suggest that due to the relevance of the subject addressed here and their direct influence on nursing, there should be further research focusing on the vital power and its relationship in the health-disease process to a greater favoring of the promotion of knowledge, to contribute to the preservation of life in its fullness.
